Ultralyd av nyrer, urinveier og milt

Prof. Odd Helge Gilja, MD, PhD

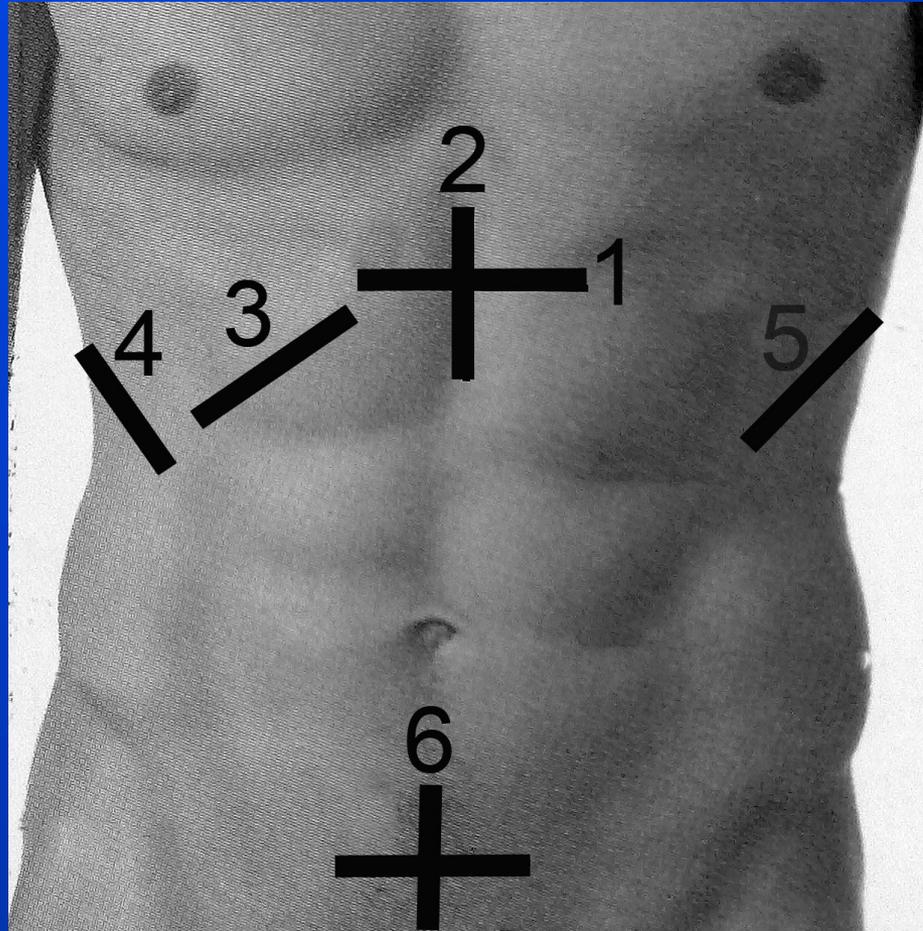

Institute of Medicine

University of Bergen, Norway

6+

A systematic ultrasound examination of the abdomen

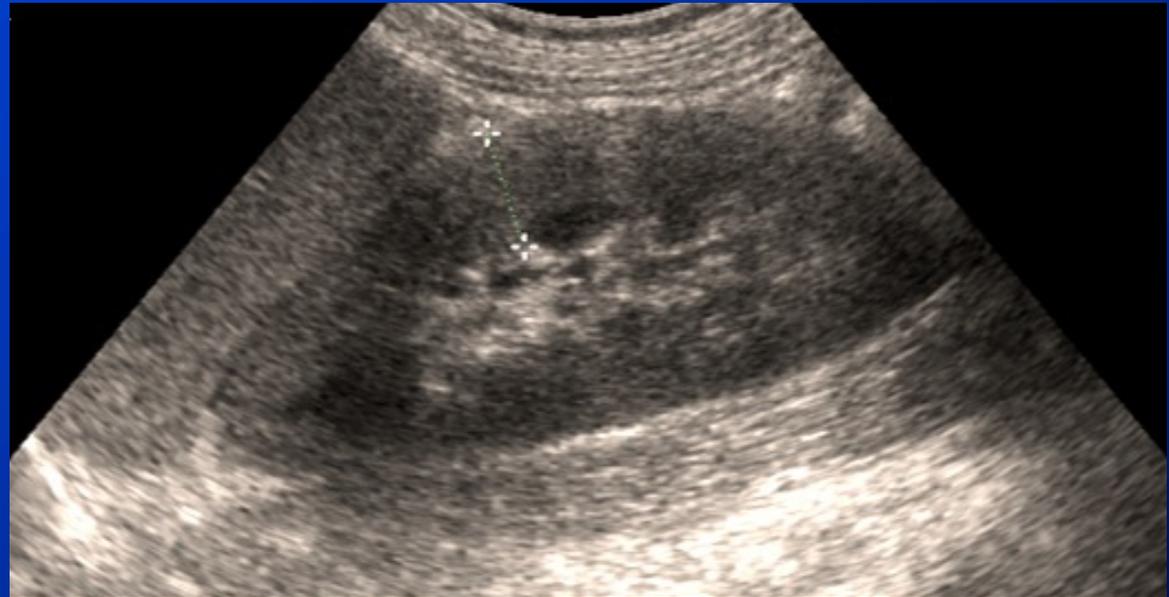

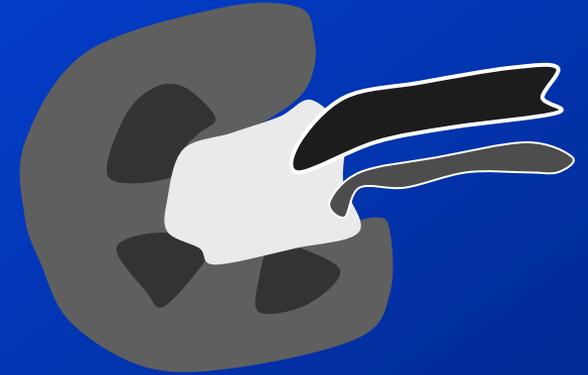

Renal Ultrasound

• Indications:

- Flank pain
- Haematuria
- Suspected renal mass
- Kidney failure
- Recurrent infection
- Fever unknown origin
- Anomalies
- Transplanted kidney
- Abdominal ultrasound

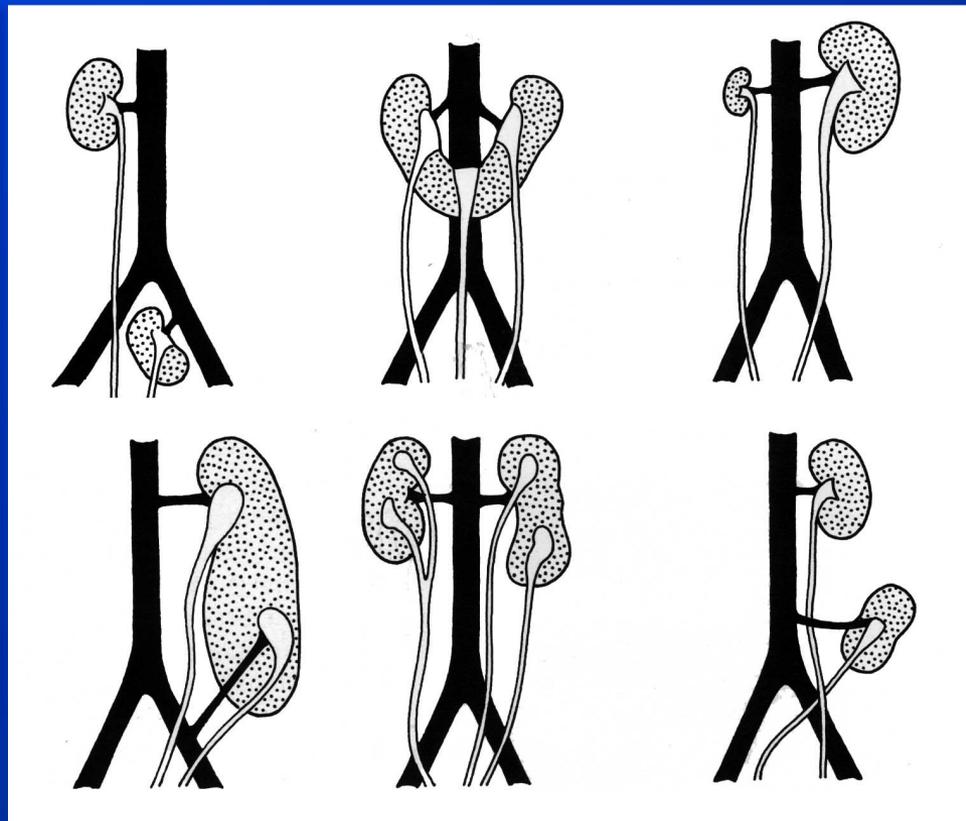

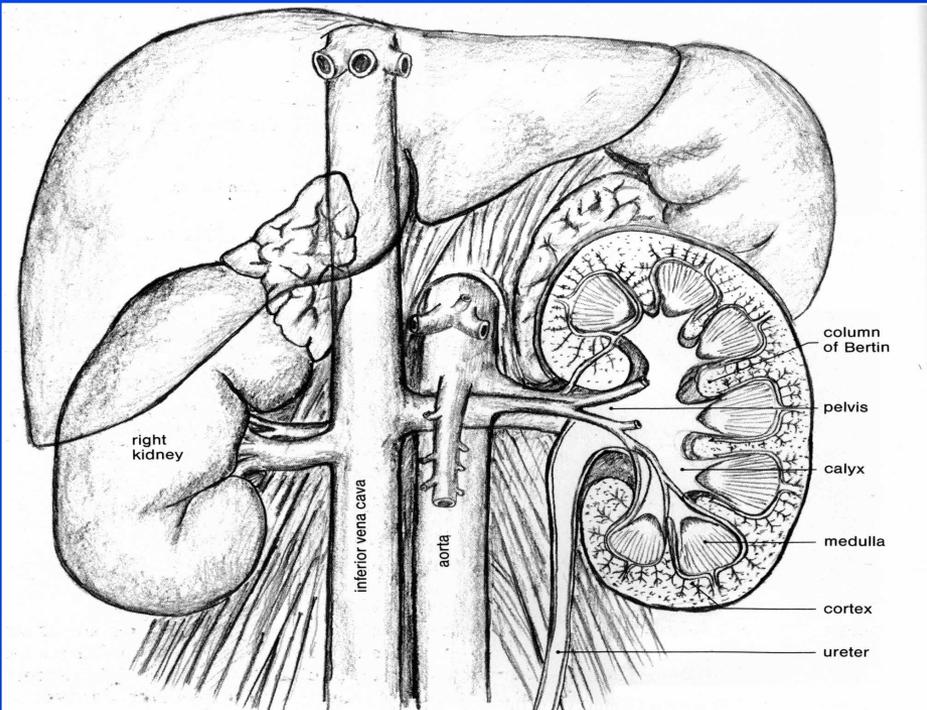

Station 4

- Long and short axis of the kidney from intercostal and subcostal lateral scanning
- Comparing echogenicity of the kidney with the liver

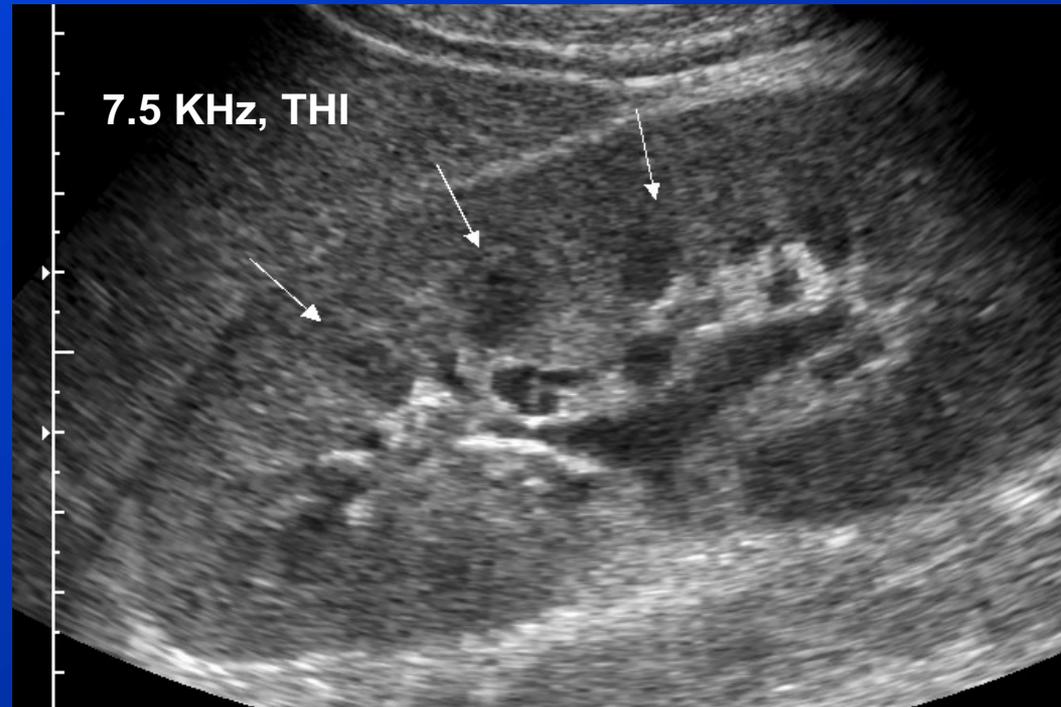

RENAL ANATOMY

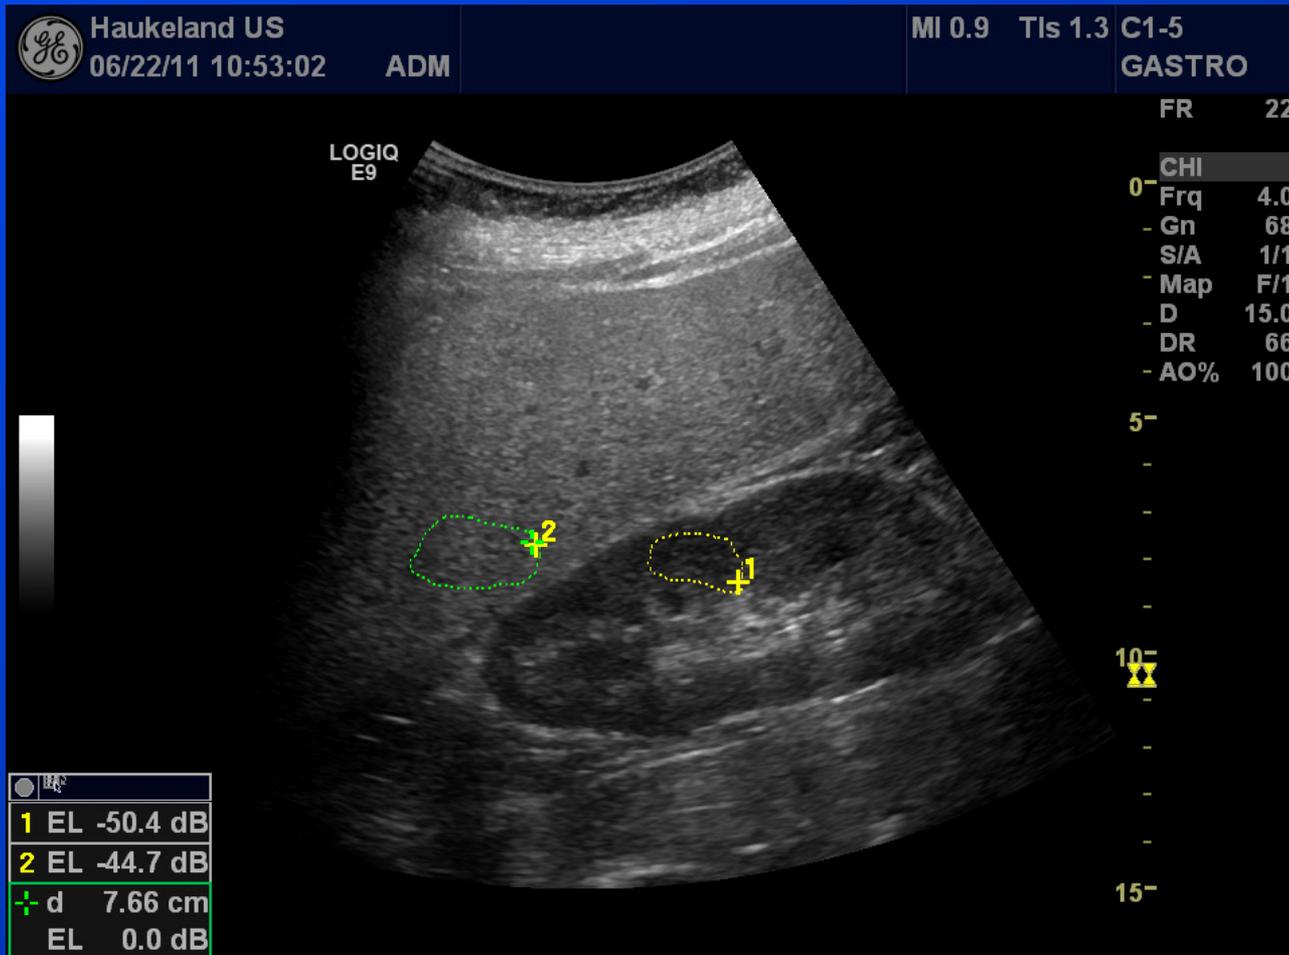

Sonoanatomy

- Ovoid structure
- 95-110 mm length
- Parenchymal width: >10 mm
- Marked "corticomedullary differentiation"
- Parenchyma darker echogenicity than liver
- Normal variations
 - "Junctional parenchymal defect"
 - "Foetal lobulation"
 - "Dromedary hump"
 - Sinus lipomatosis

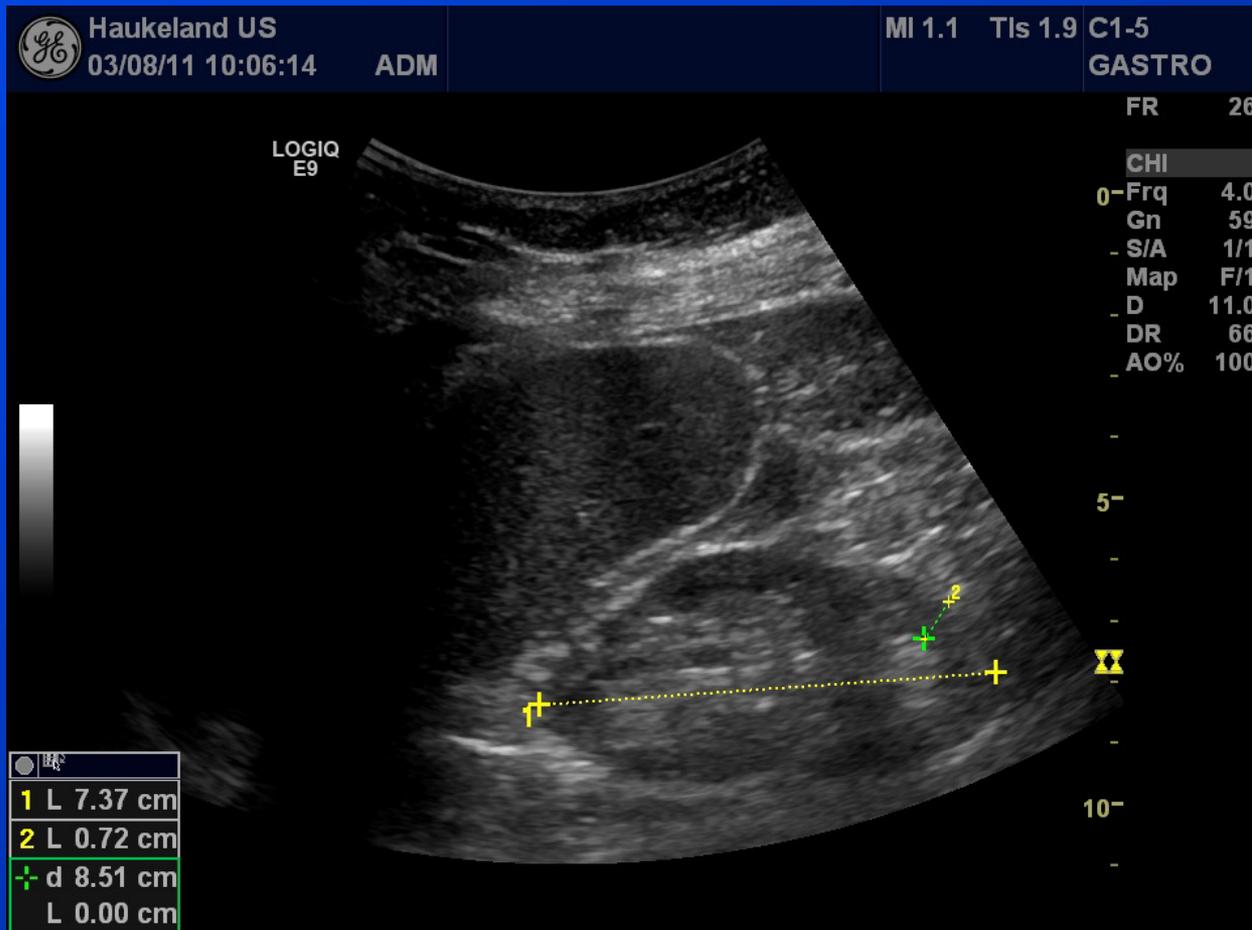

Compared to fatty liver

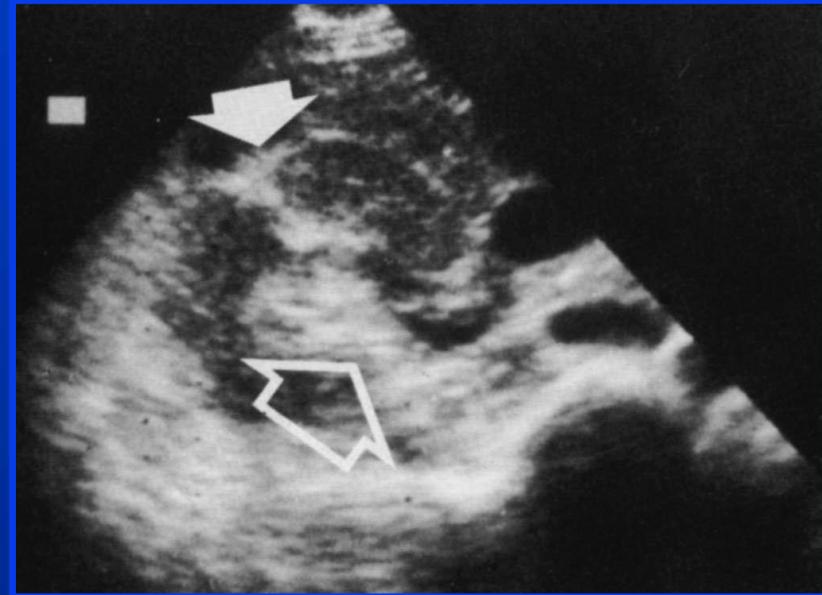

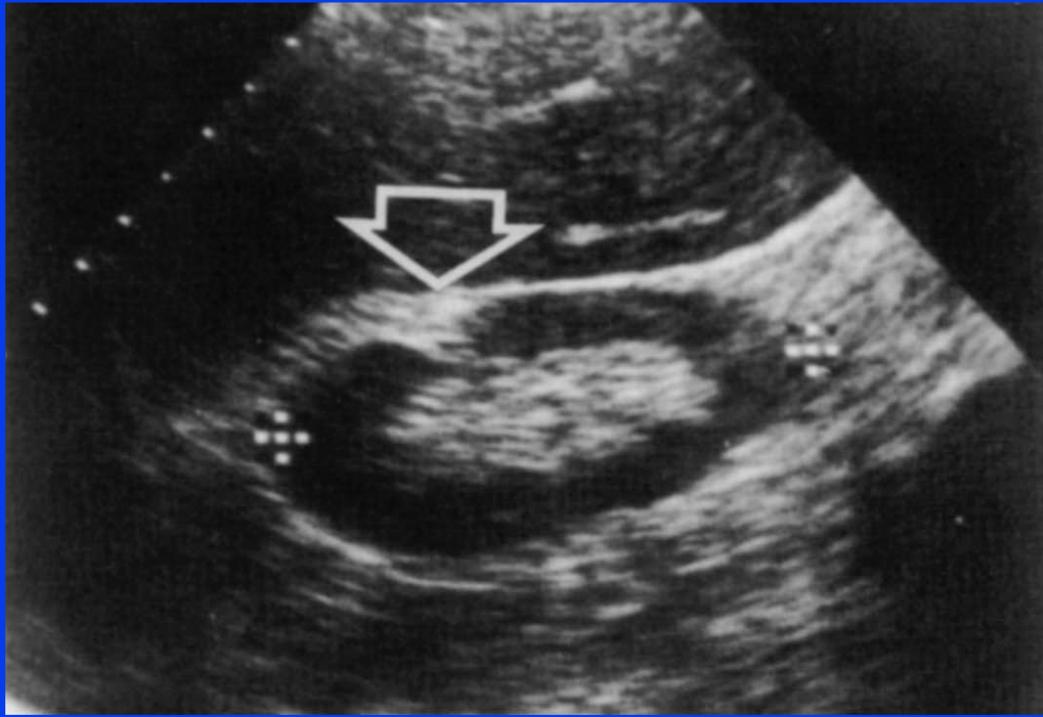

Atrophy of the Kidney

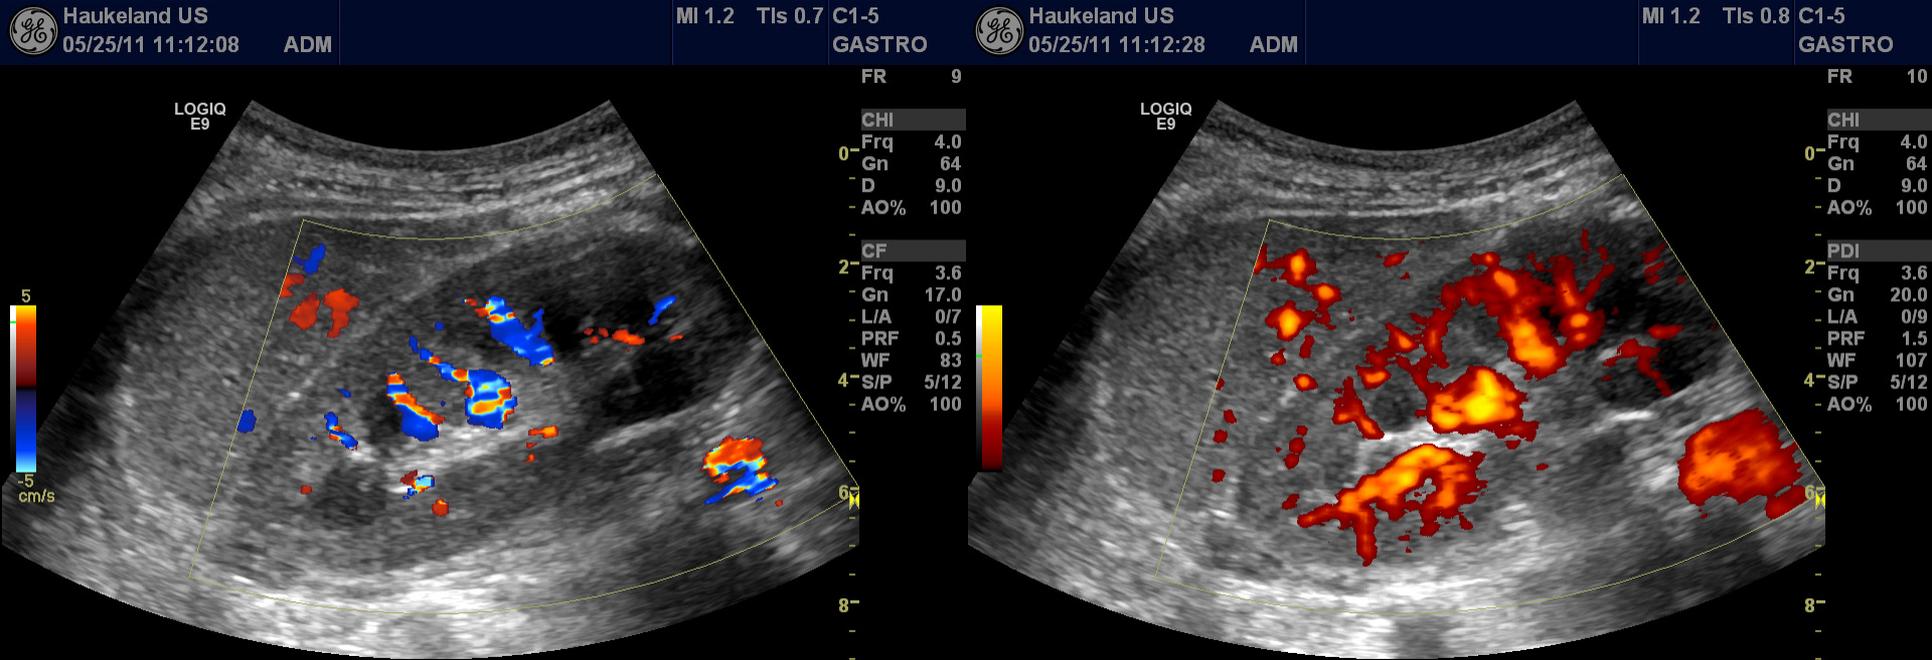

Scar of the kidney

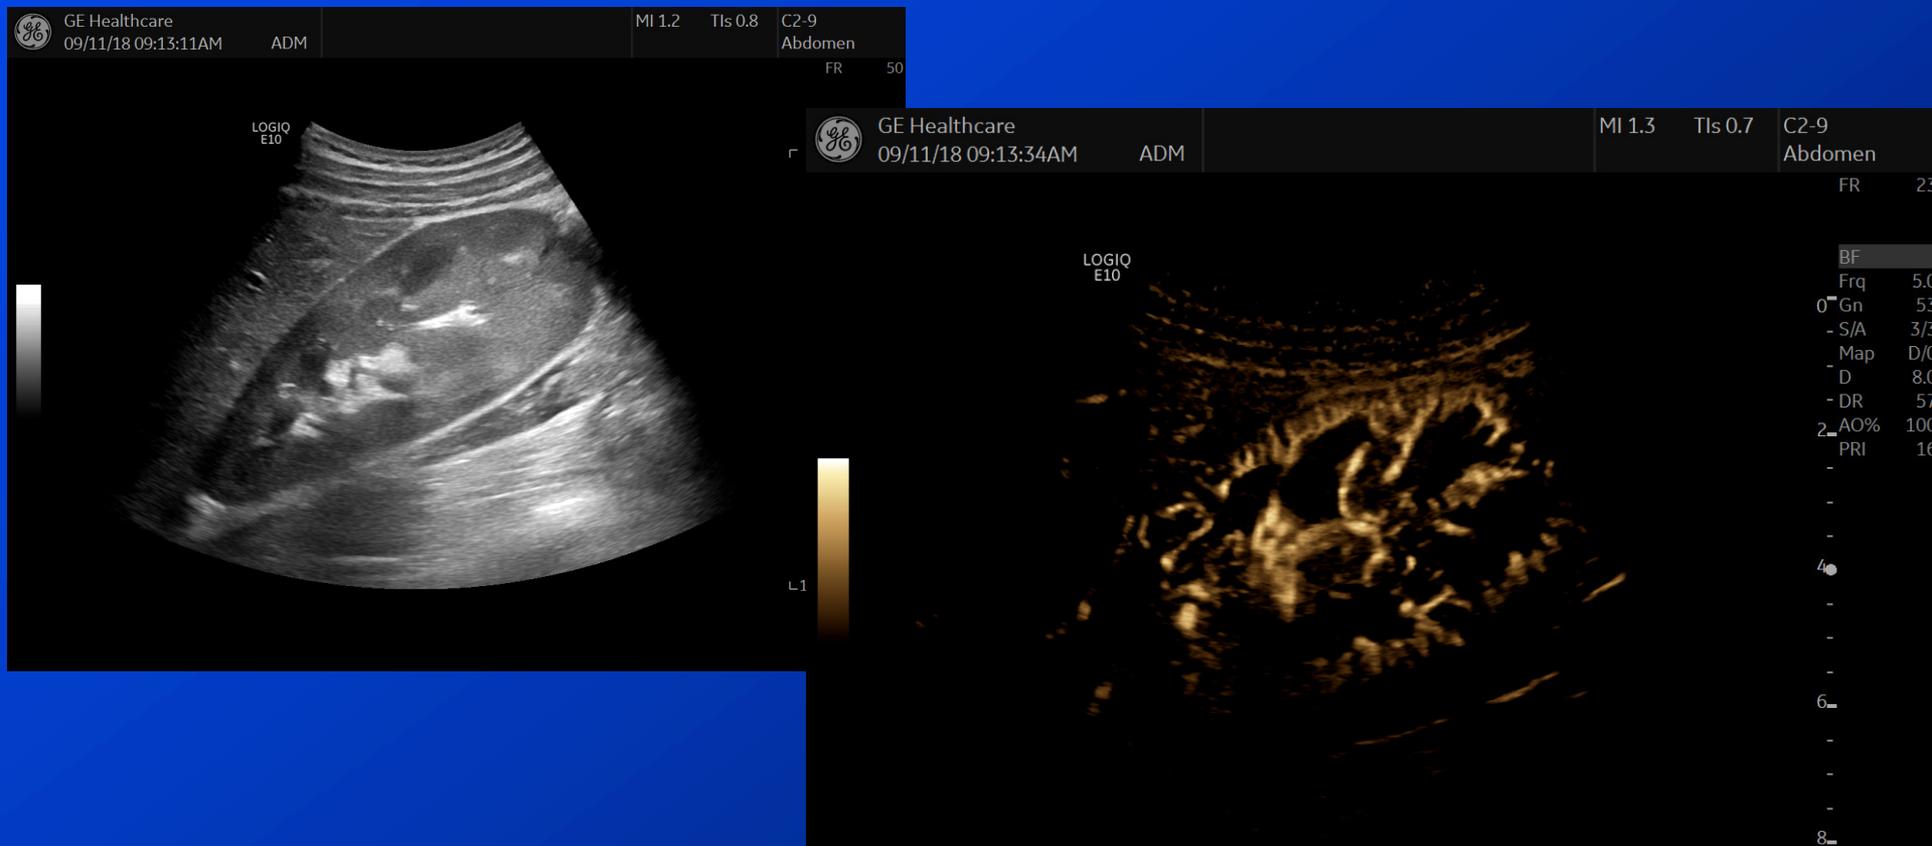

Doppler of the Kidneys

B Flow

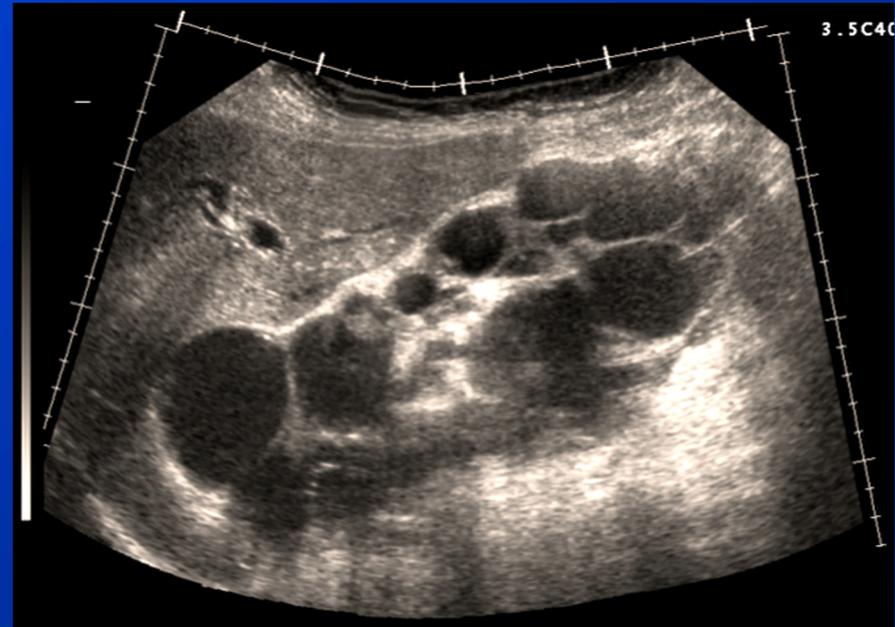

B Flow real-time dynamics

PATHOLOGY

- Hydronephrosis
- Nephrolithiasis
- Parenchymal diseases
- Infection
- Expansive processes
- Transplantation
- Trauma

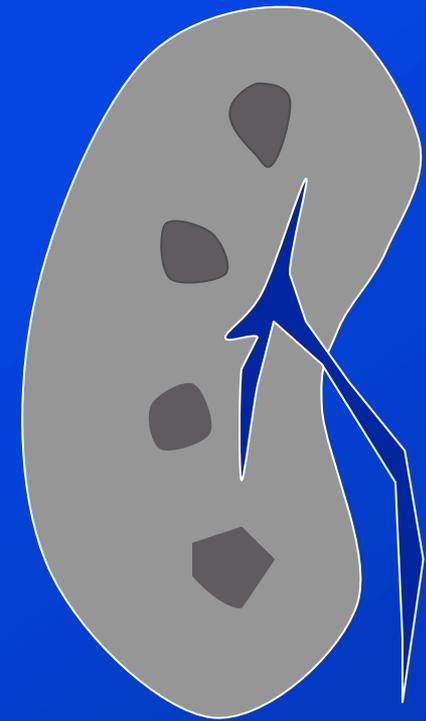

HYDRONEPHROSIS

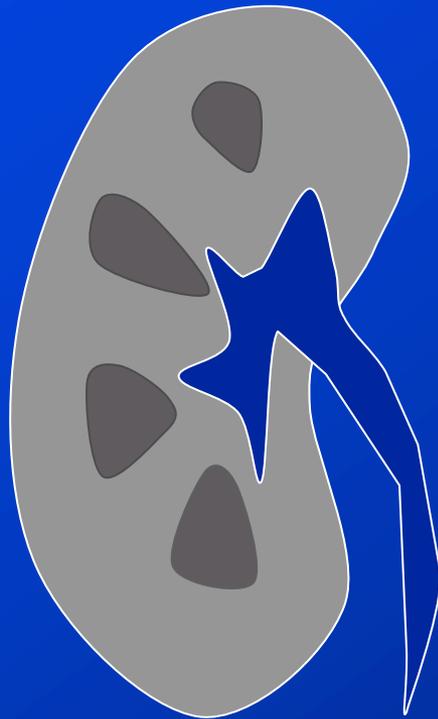

- Physiological
 - Full U-bladder
 - Pregnancy
- Pathological
 - Congenital
 - Reflux, valves, stenosis, ectopies, uretheroceles, megacalyces/urethers
 - Obstruction
 - Strictures after infection/trauma, prostate hyperplasia, malignancy, stones, retroperitoneal fibrosis, obstipation in children, post-operatively
 - Infection

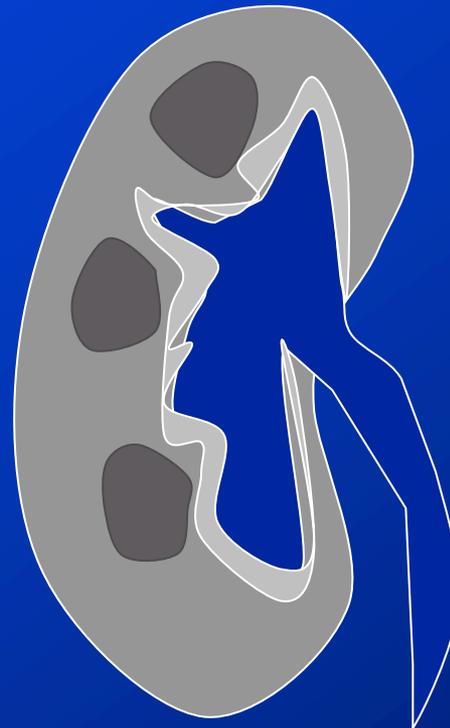

Range of Hydronephrosis

Normal

Mild

Moderate

Severe

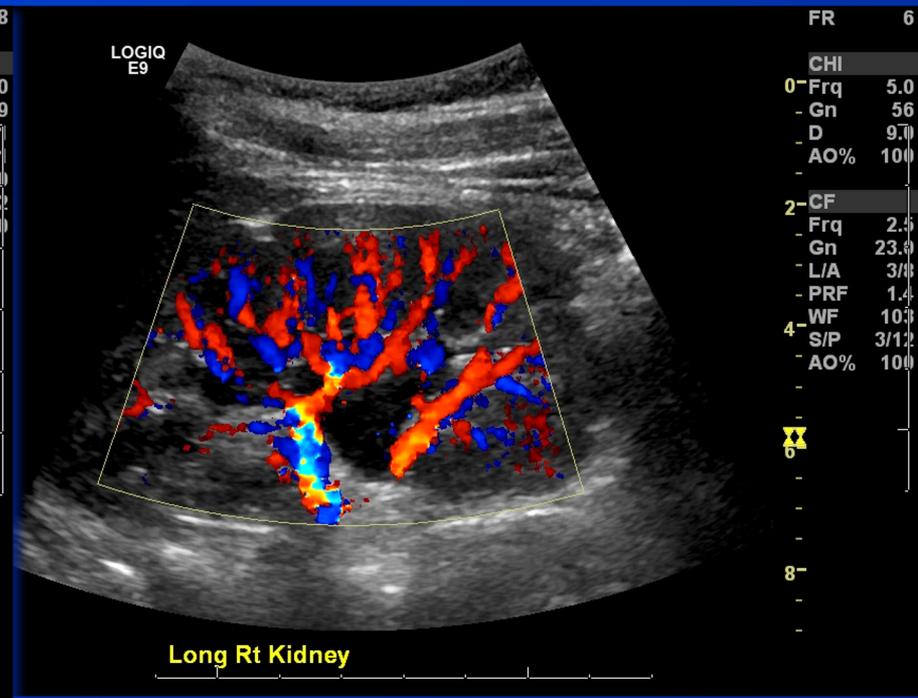

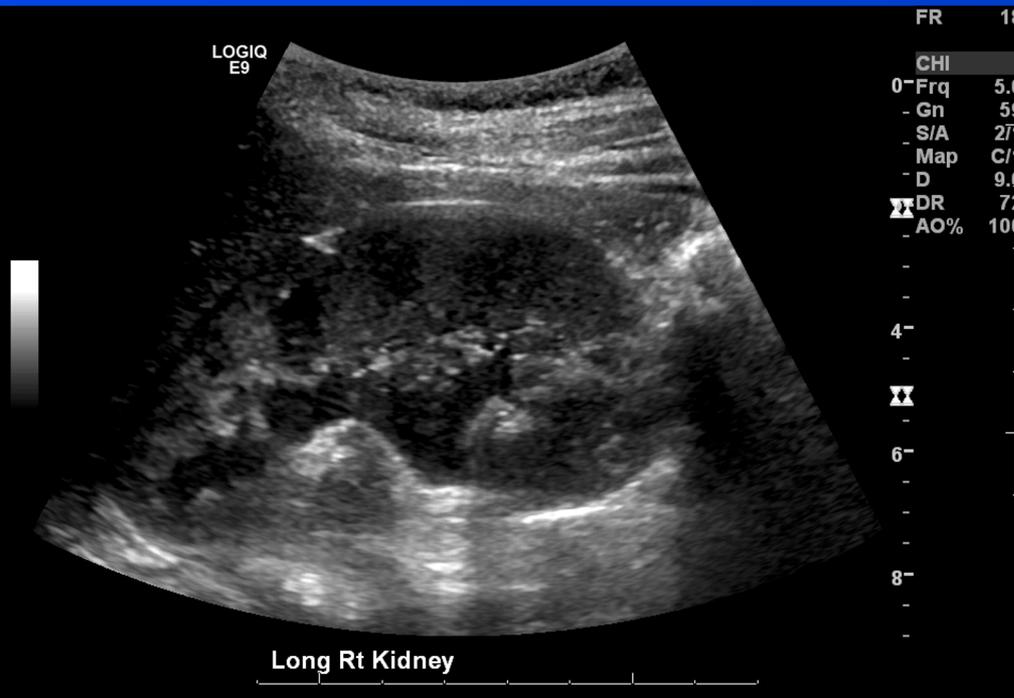

Hydronephrosis

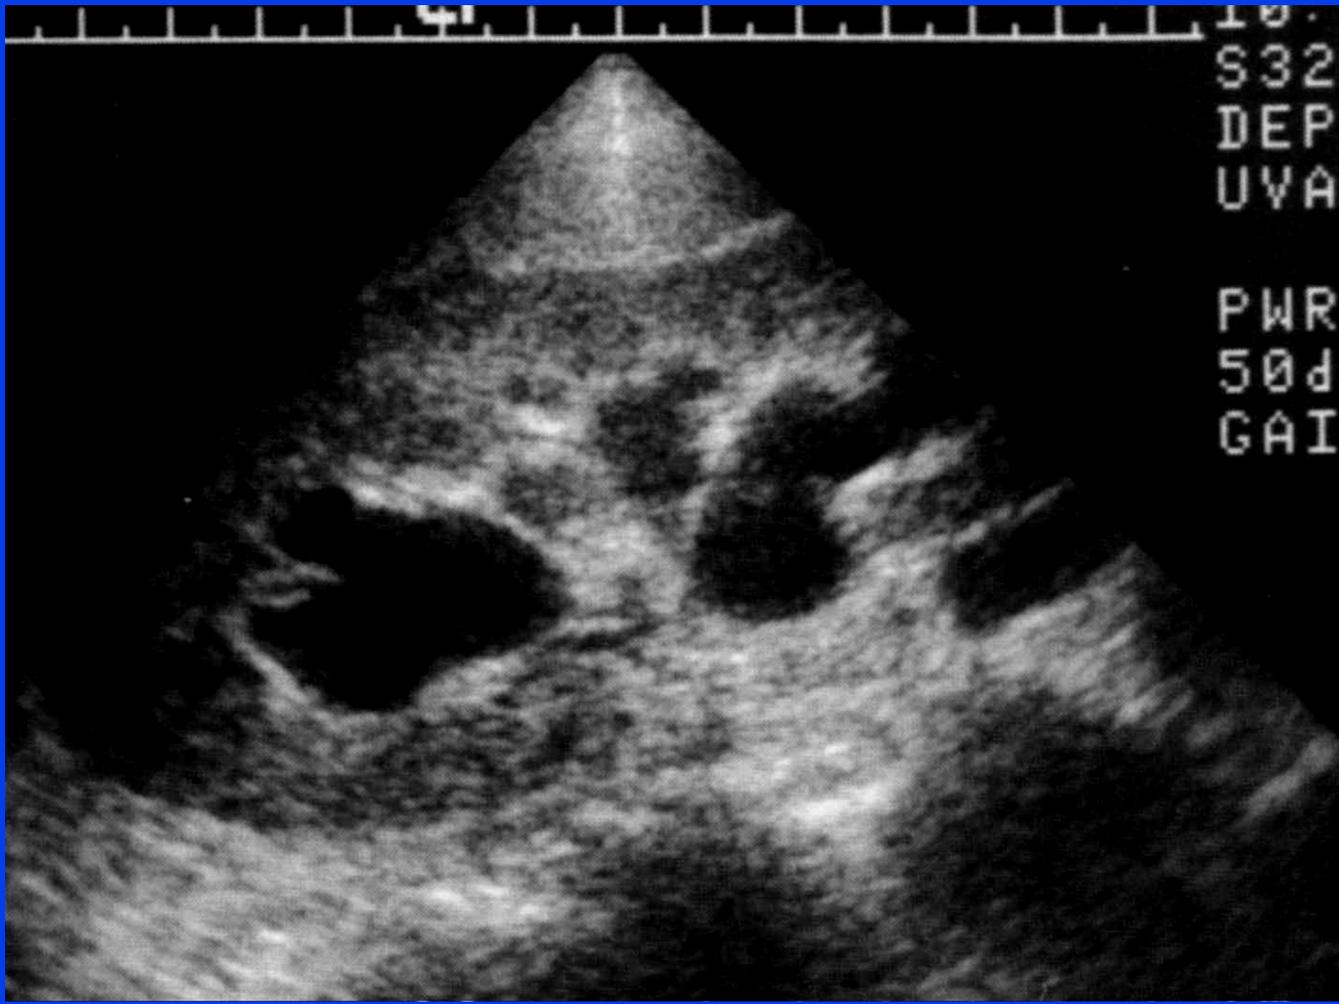

Use the Doppler !

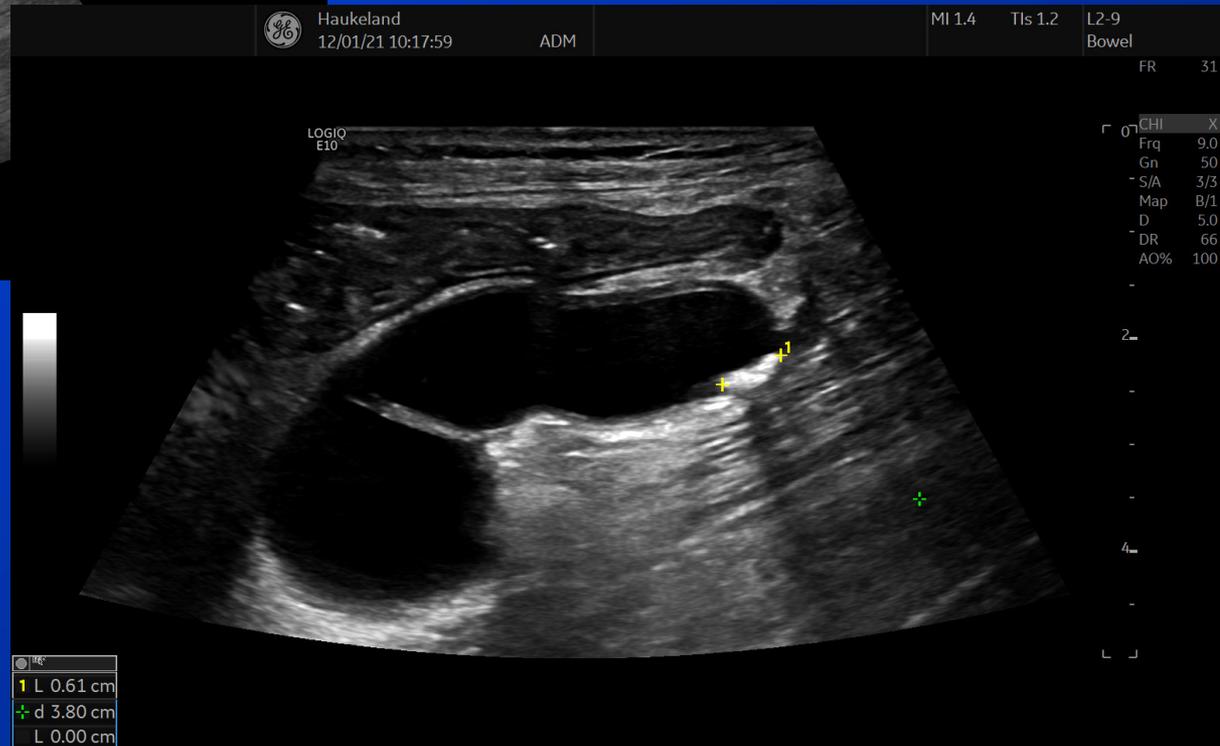

Hydronephrosis

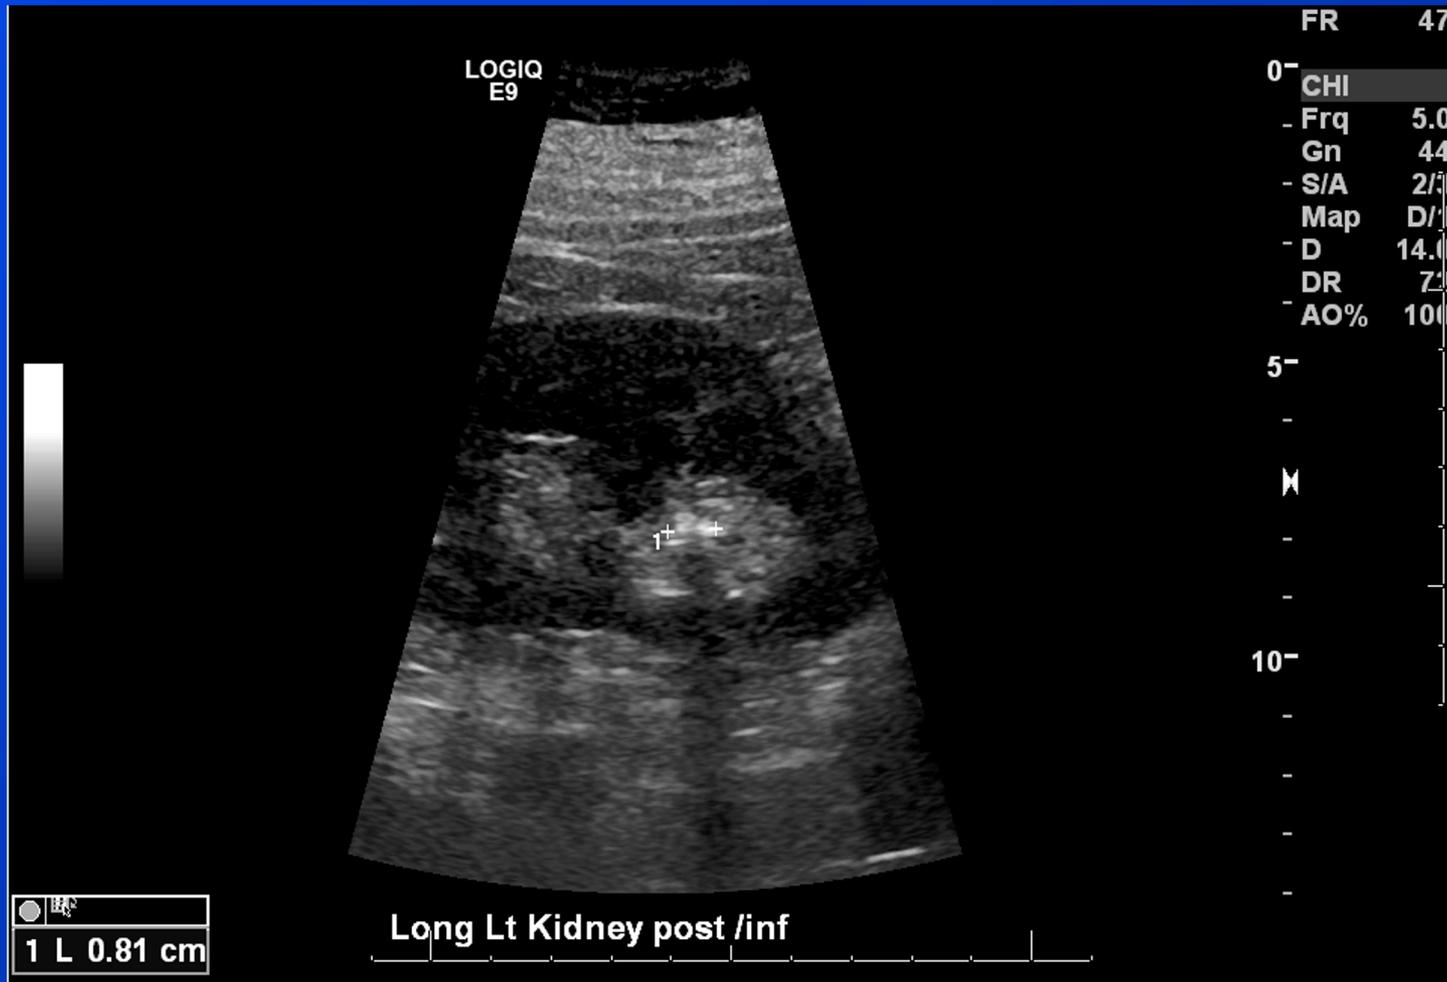

Female, 40 years with Crohn

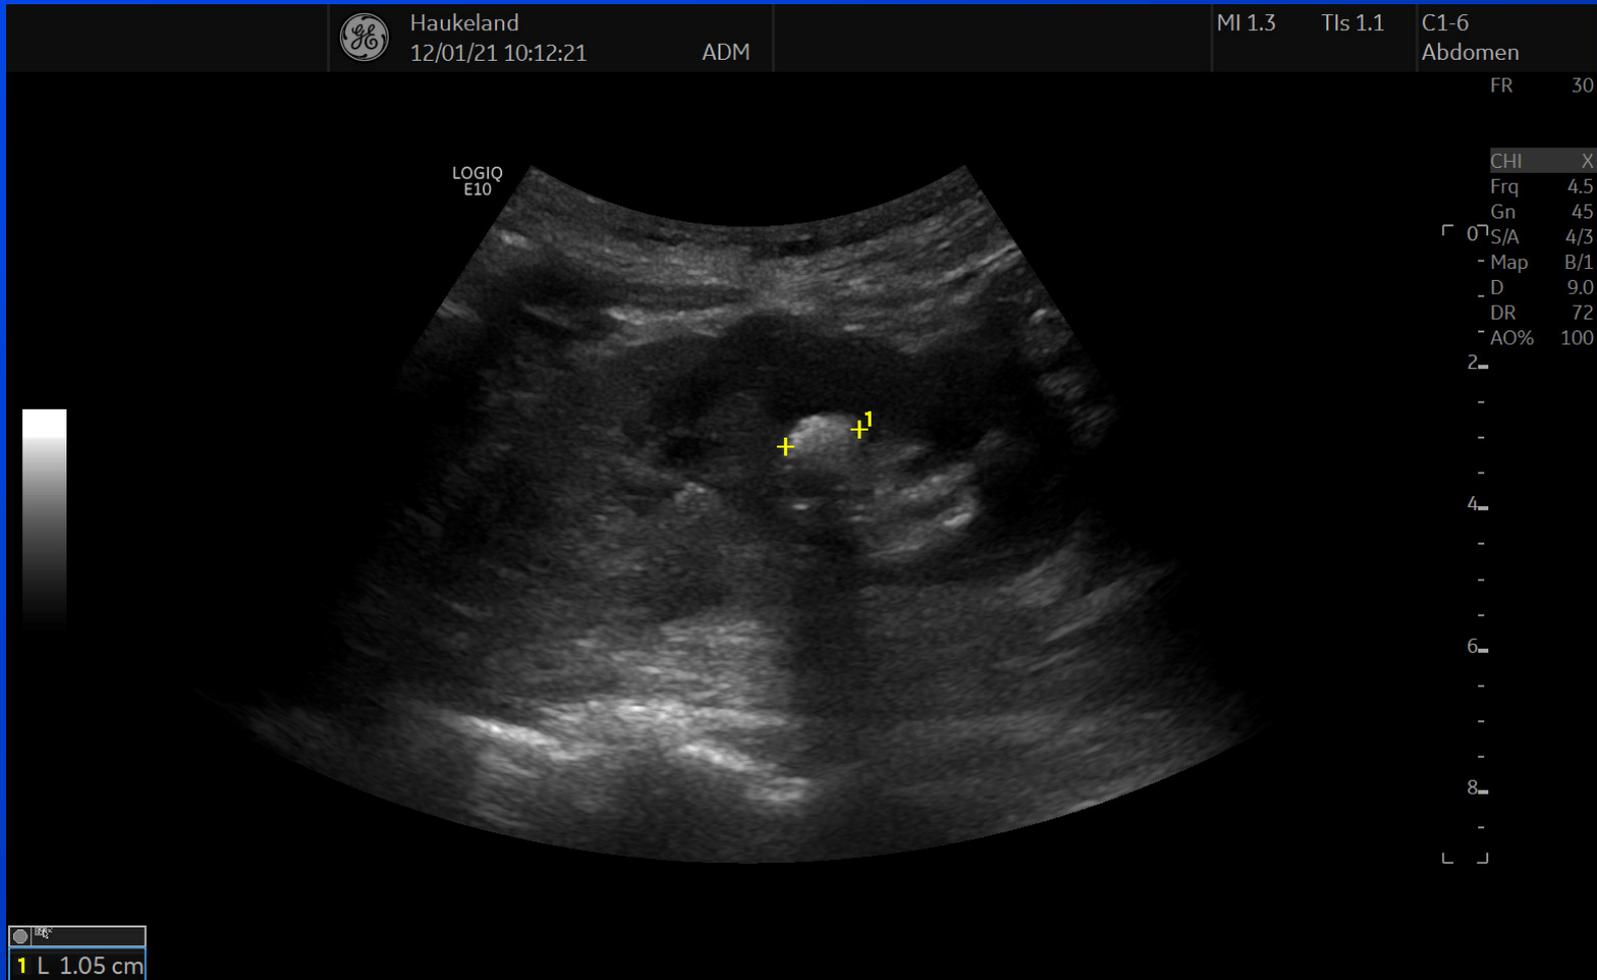

Kidney stone

Kidney stone

Acute Pyelonephritis

ultrasound findings:

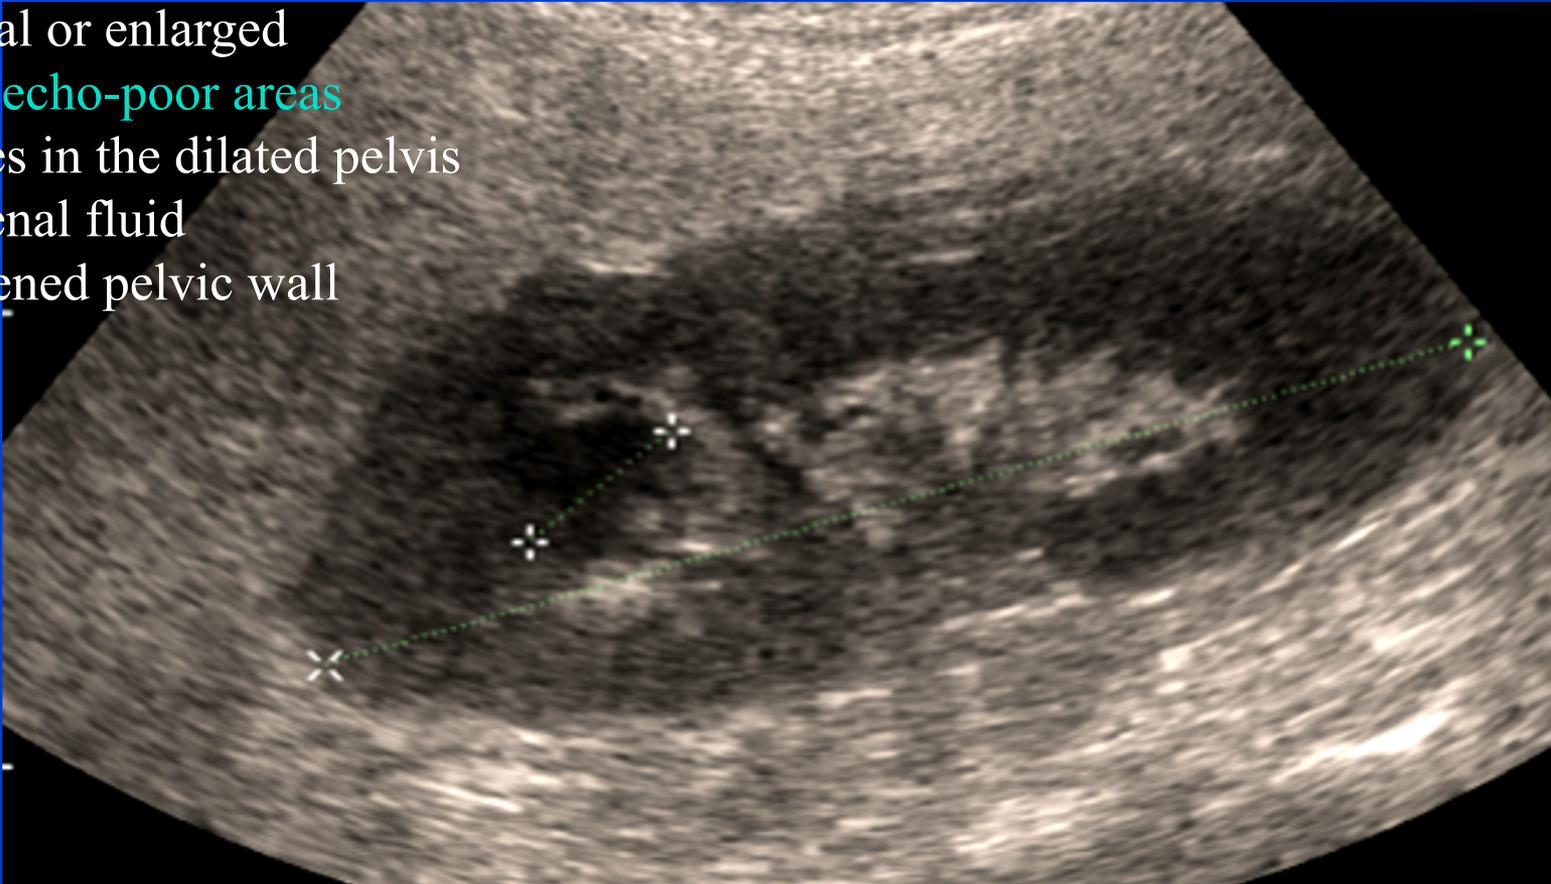

normal or enlarged

focal echo-poor areas

echoes in the dilated pelvis

perirenal fluid

thickened pelvic wall

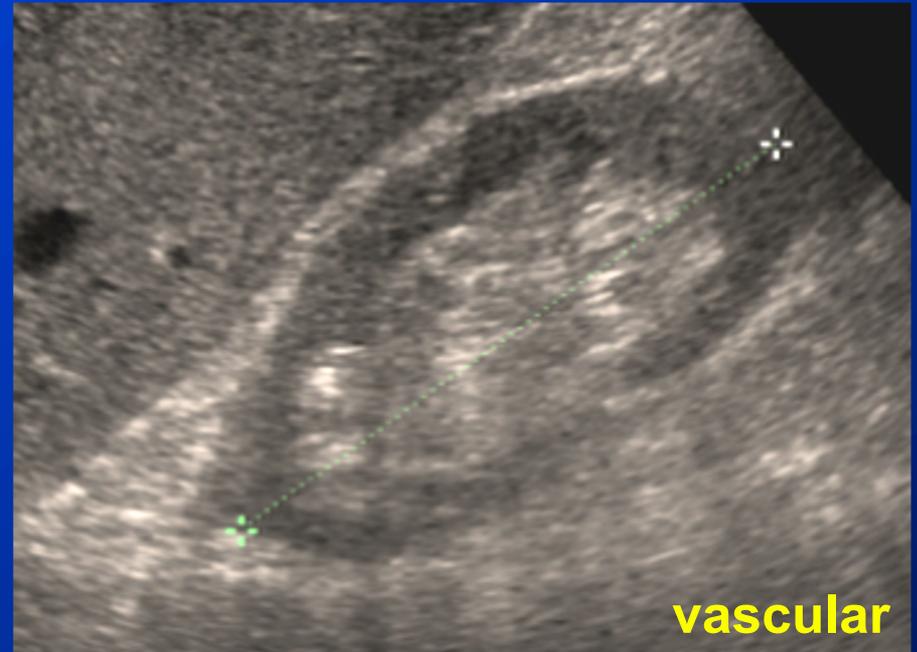

Chronic pyelonephritis

ultrasonic appearance:

- small kidney
- small echo-rich parenchyma
- blurred border between parenchyma and central complex
- scars

Final stage of chronic renal disease: Atrophy or „Putty kidney“

Kidney tumors

- A: Benign

- Cysts
- Angiomyolipoma
- Oncocytoma
- (Pseudotumor)

- B: Malignant

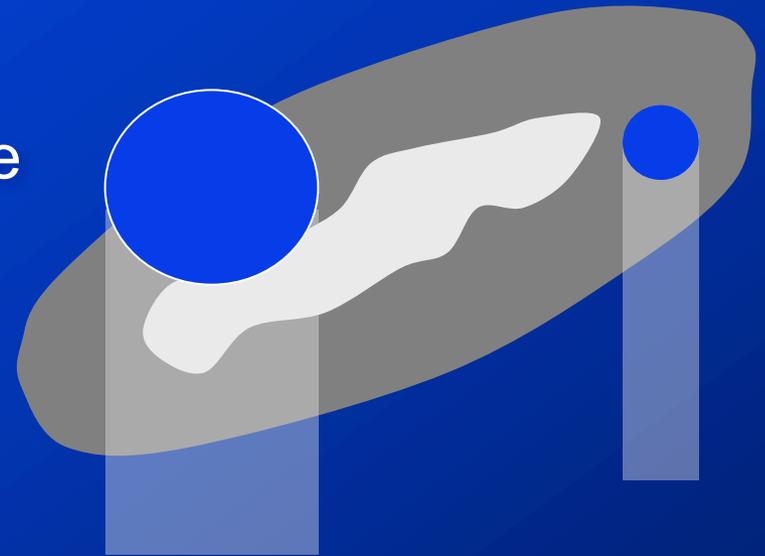

- Carcinoma (RCC)-80%
- Adenoma (10%)
- Urothel-carcinoma
- Lymphoma
- Metastasis

Renal cysts

Simple renal cyst

- Very common! (> 50% of people > 50)
- Clearly defined smooth wall
- Echo-free
- Posterior enhancement
- Hairline septa possible

BOSNIAK'S CLASSIFICATION

- Type 1:
 - Smooth wall, anechoic, < 20HU at CT. "simple cysts"
- Type 2:
 - Thin septa, small calcifications, evt. hyperdense (< 90HU (blood, proteins).
- Type 3:
 - "Indeterminate". Thick irreg. calcifications, thick septa, irreg. borders
- Type 4:
 - Solid tumors with cystic sections.

Who was Dr. Morton Bosniak?

- A radiologist at NYU
- He reported in 1986 a new classification system
 - Based on CT

BOSNIAK'S CLASSIFICATION

Bosniak groups

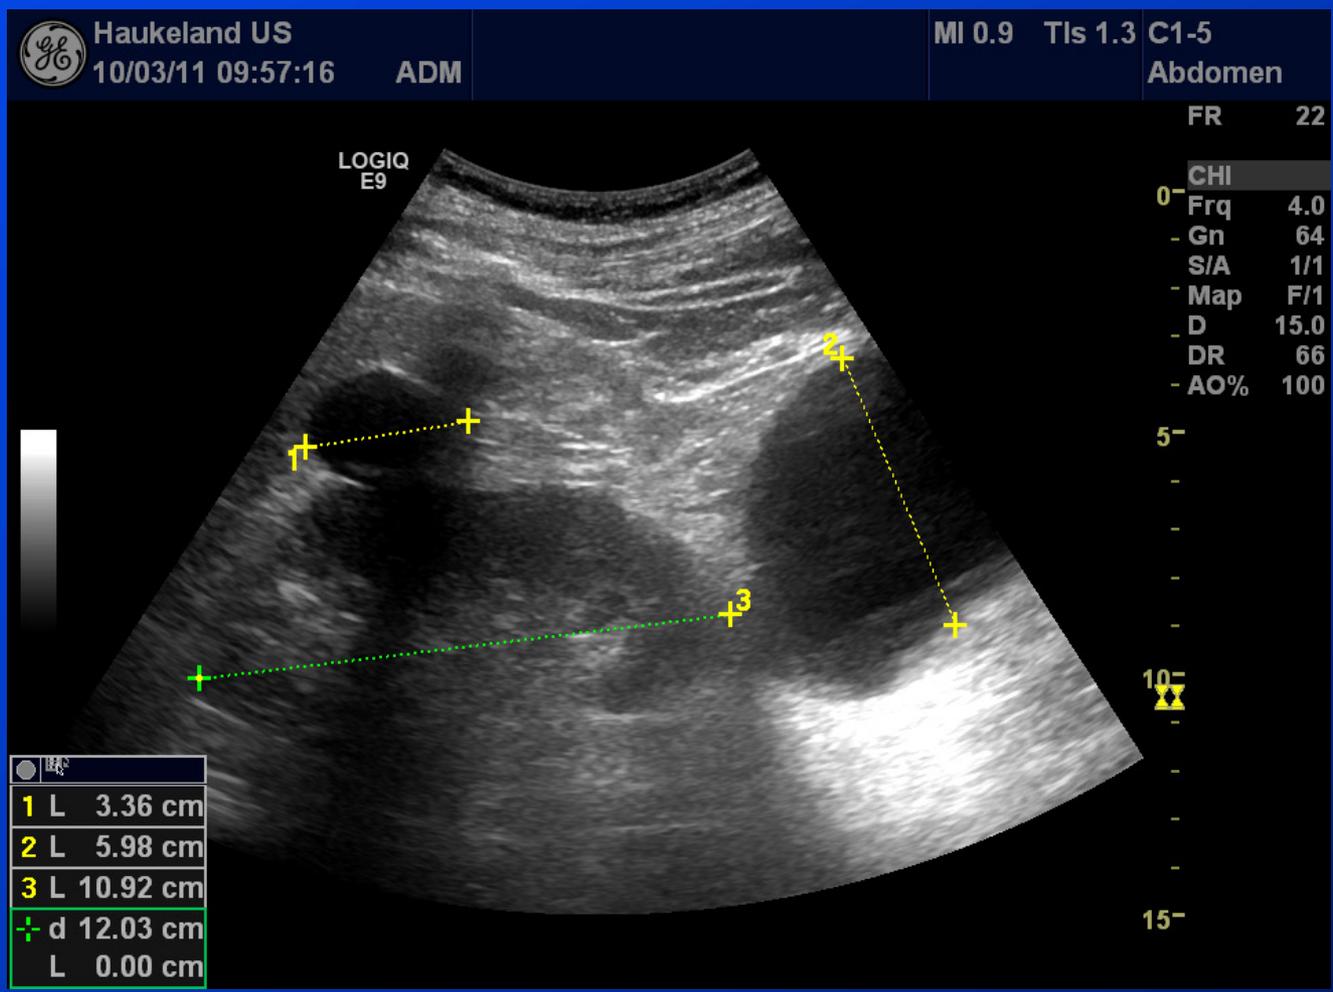

- Bosniak I: simple cyst (benign)
- Bosniak II: minimally complex cyst (benign)
- Bosniak IIF (follow): slightly more complex than II, not yet III (95% benign)
- Bosniak III: complex cysts (40-60% malignant)
- Bosniak IV: mixed cystic-solid lesion (85-100% malignant)

Bosniak classification criteria

- septa
- cyst content
- contrasting
- solid shares

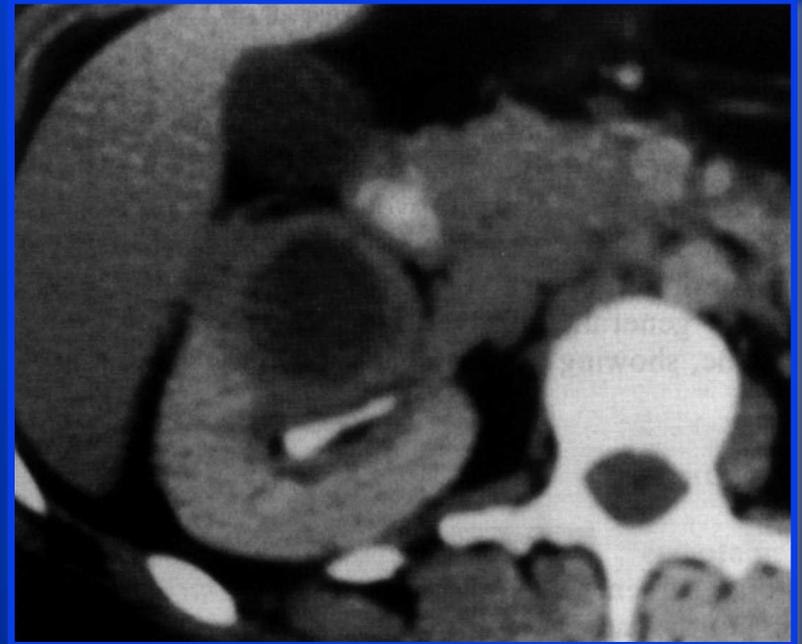

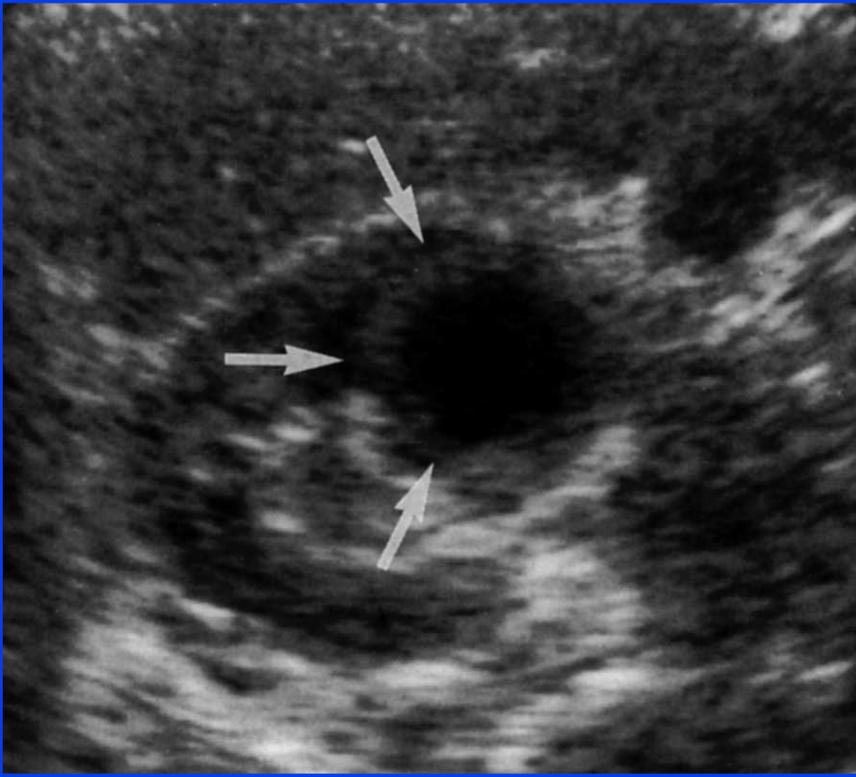

Cysts on left Kidney

Bosniak Type 3

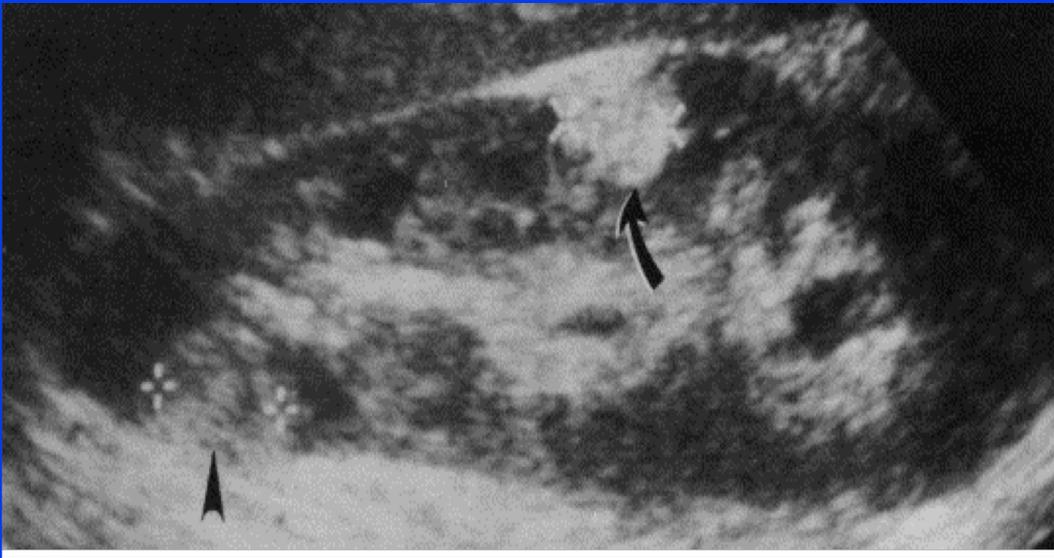

ANGIOMYOLIPOMA

- Hamartoma; vessels, fat and smooth muscle
- Isolated 80%:
 - Most in females 40-50 years
 - Often hemorrhage if > 4 cm
- Part of tuberous sclerosis in 20%
 - 50% are bilaterale and multiple
- Benign tumor
- Hyperechogenic tumors without any symptoms

ANGIOMYOLIPOMA

Angiomyolipoma

Renal Cell Carcinoma

- 80 % of solid kidney tumors
- Male > Female 3:1
- Incidence: 450/year in Norway
- Increased risk:
 - Hippel-Lindau
 - Chronic dialysis
- 2-3% synchrone tumor in contralateral kidney

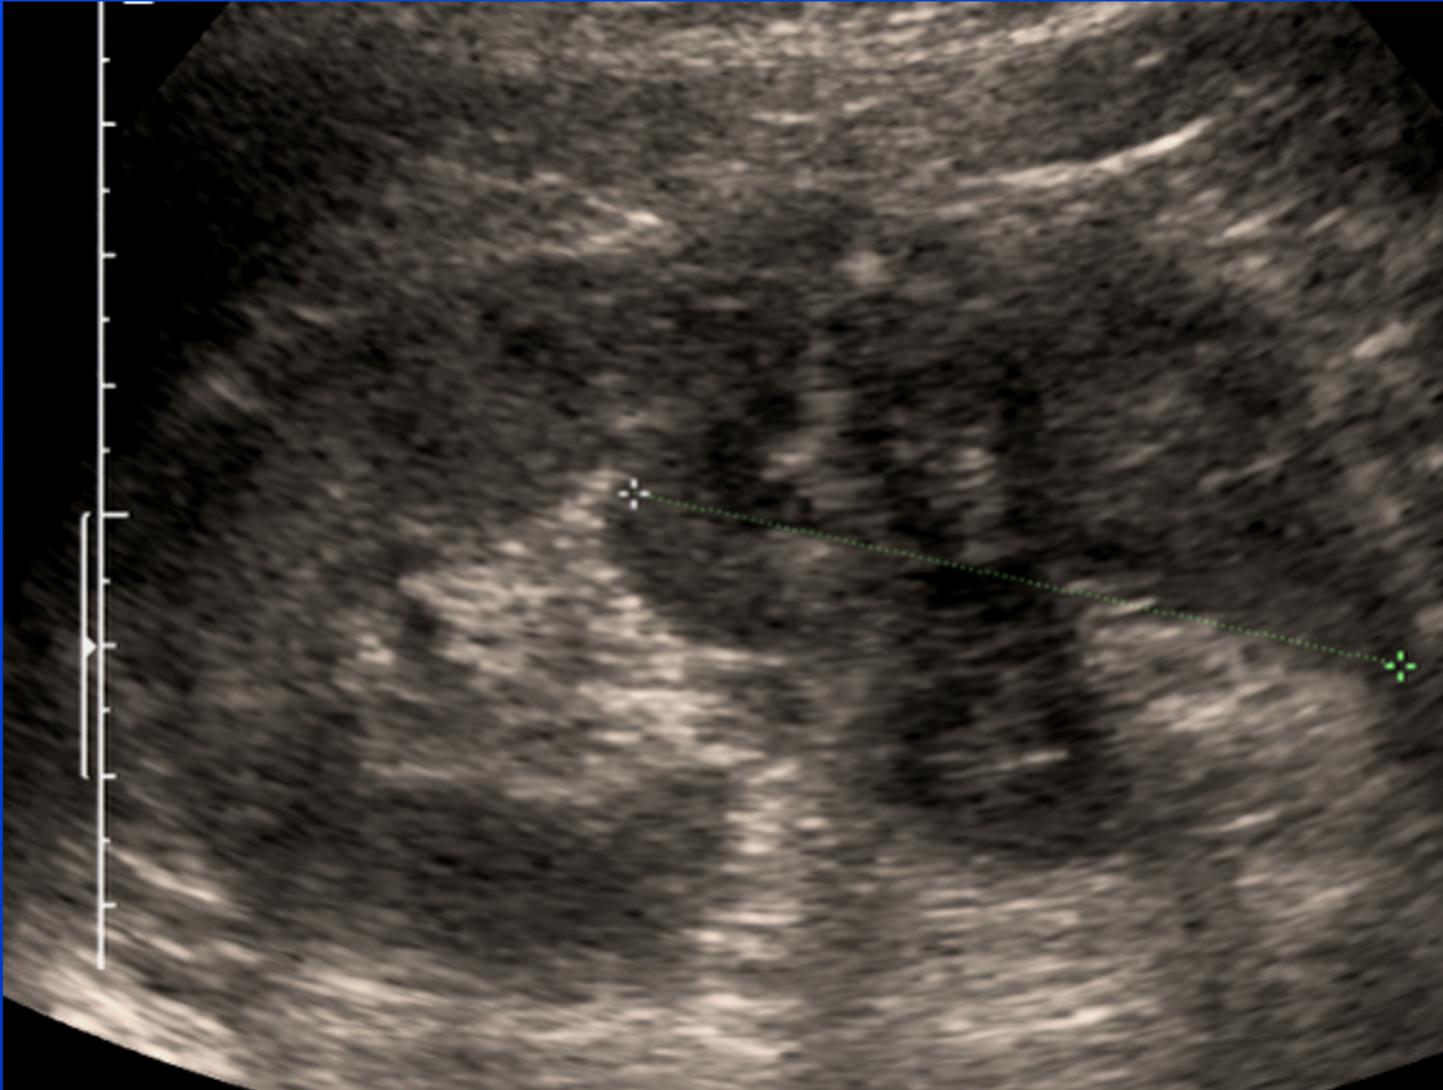

Renal cell carcinoma

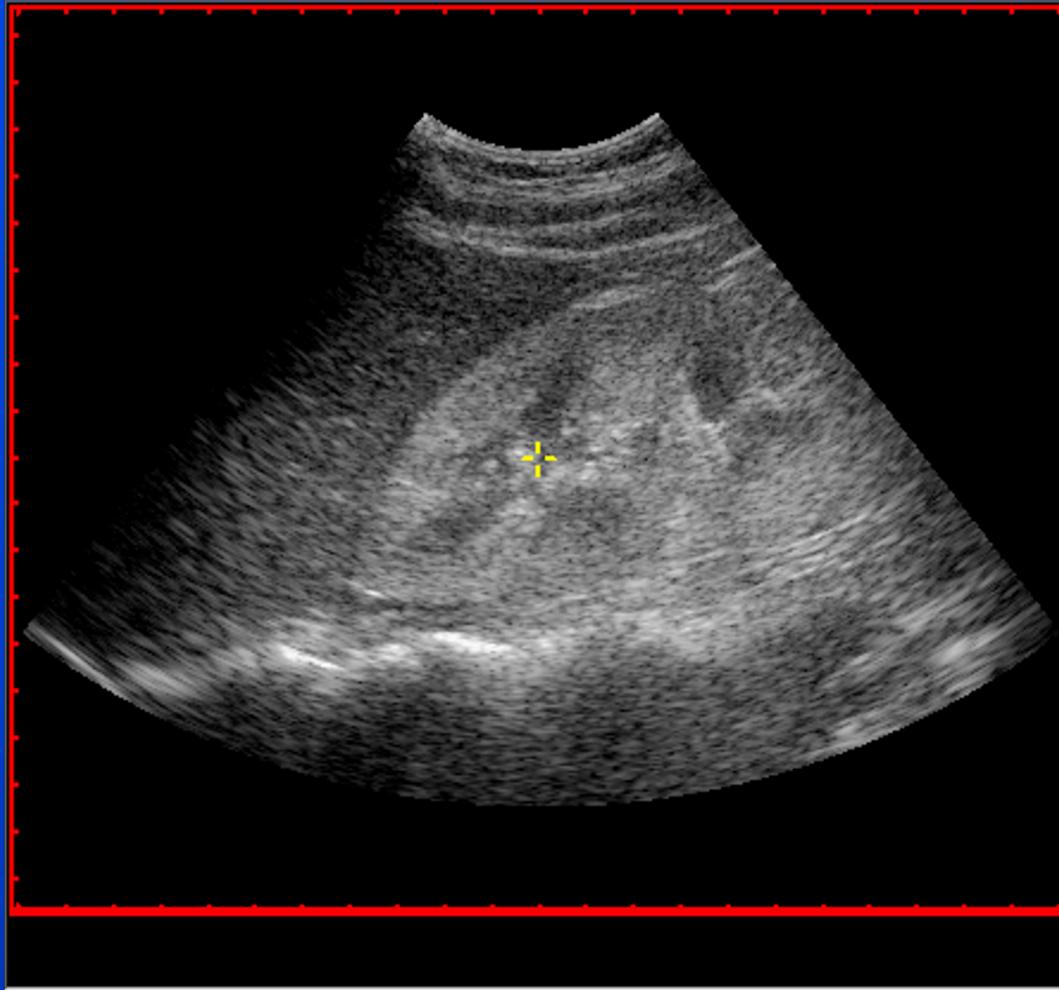

Renal cell carcinoma

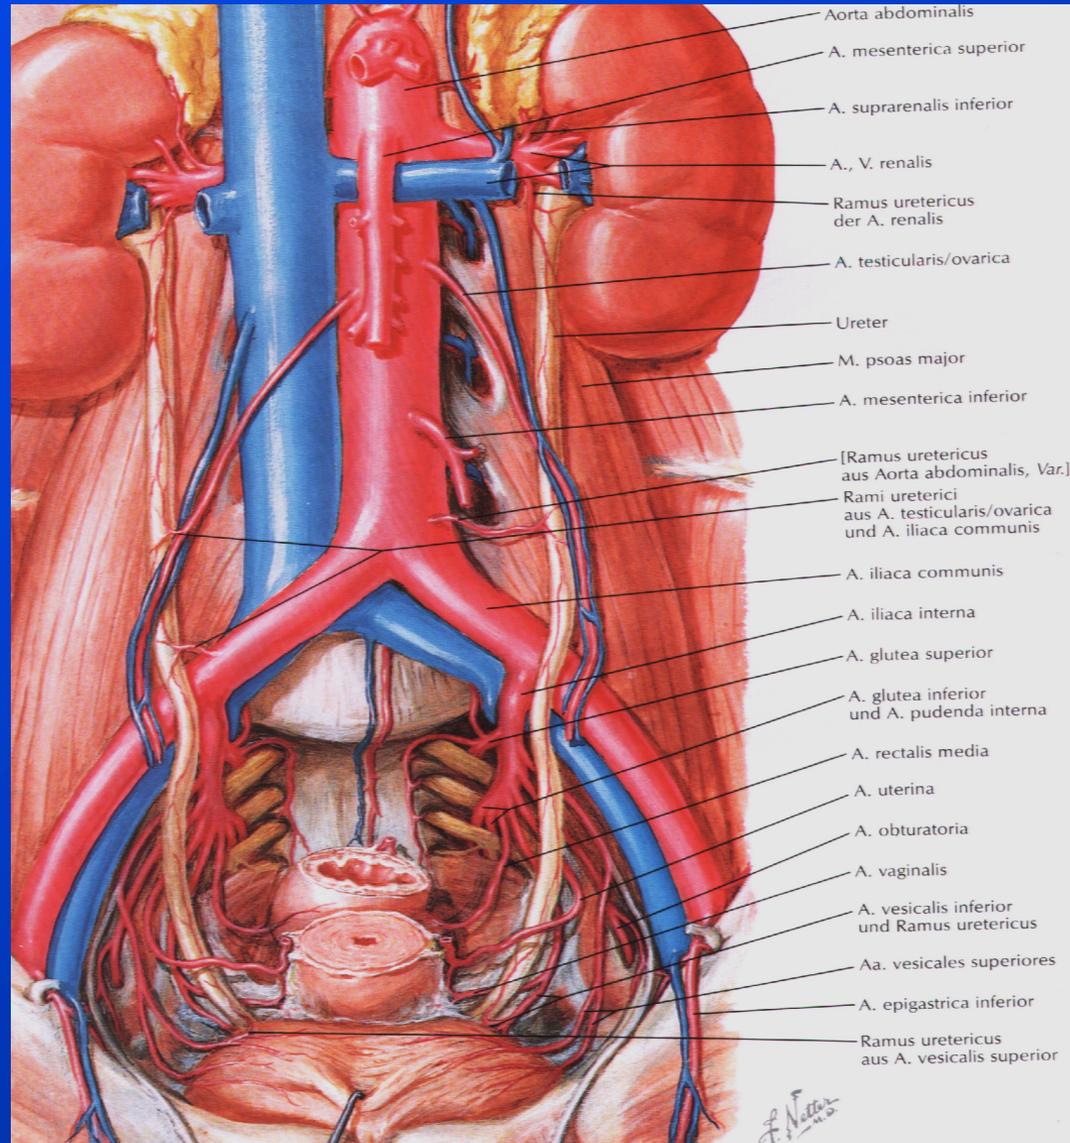

Hyperechogenic kidney

Defroster liquid (Ethylen Glycol) intoxication
with oxalat sedimentation

Diffuse splenomegaly

- Inflammation and immunology
 - Infectious: Endocarditis, mononucleosis, tuberculosis, brucellosis, schistosomiasis, CMV, syphilis, histoplasmosis, malaria, HIV
 - Connective tissue diseases: RA, SLE, Felty`s s.
 - Sarcoidosis
- Blood disorders
 - Neoplasms: Lymphomas, leukemias, histiocytosis, myeloproliferative disorders
 - Hemolytic anemia, hemoglobinopathies
- Congestive splenomagaly
 - Cirrhosis, portal or splenic vein thrombosis
- Metabolic diseases
 - Gaucher, Niemann-Pick, Amyloidosis

Splenomegaly

DX: Mononucleosis

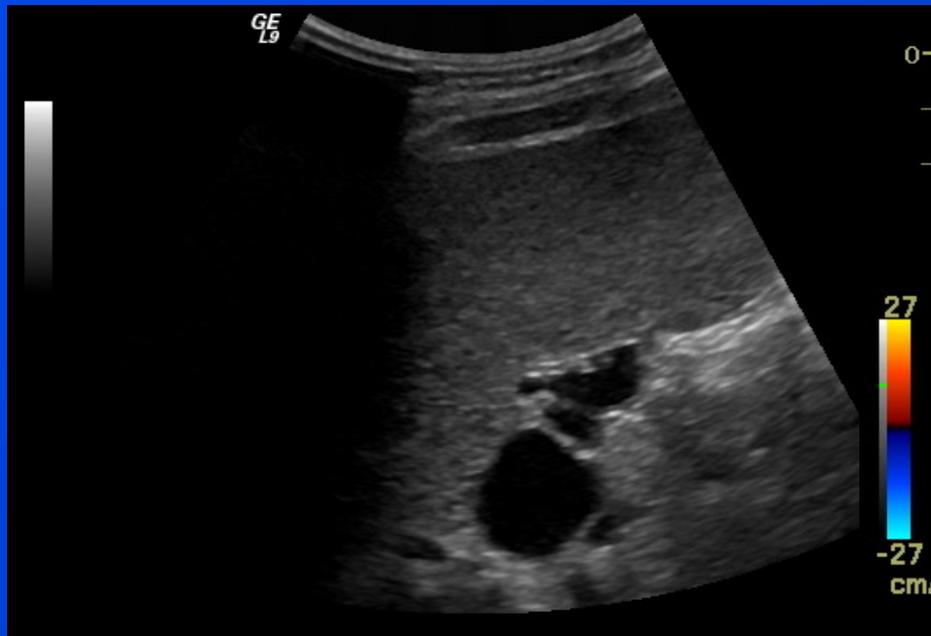

Massive splenomagali

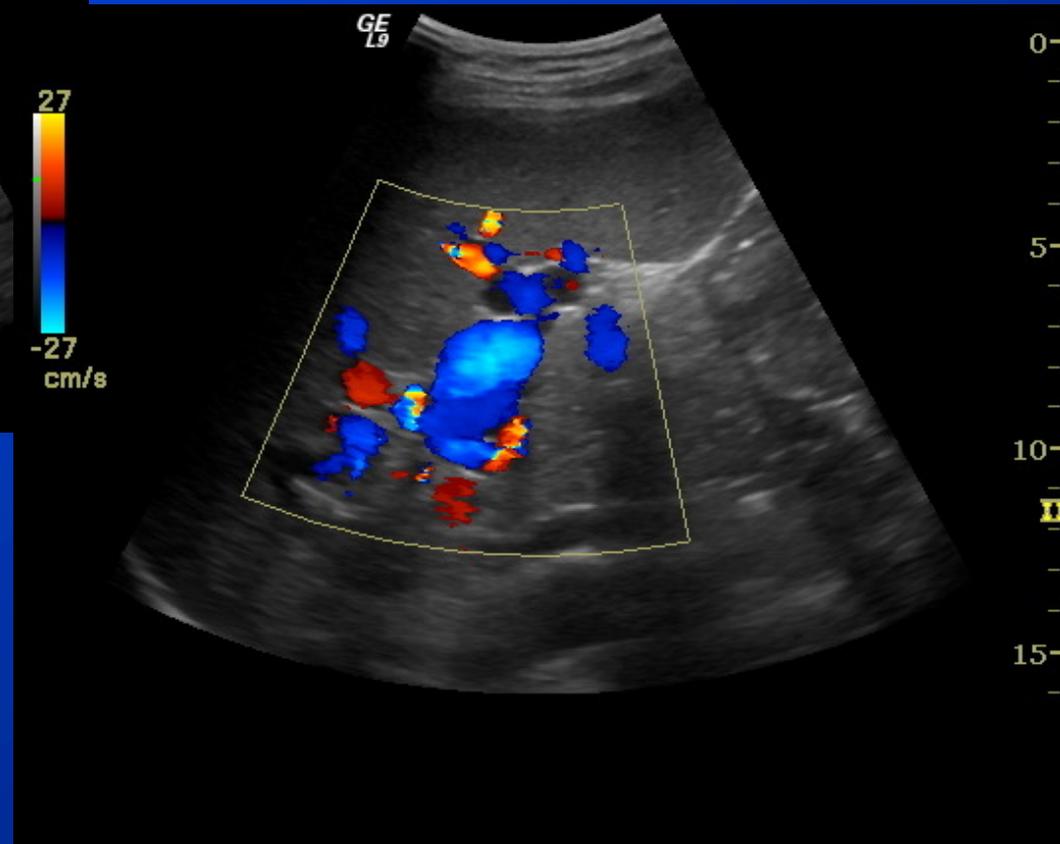

If in doubt, sound it out !

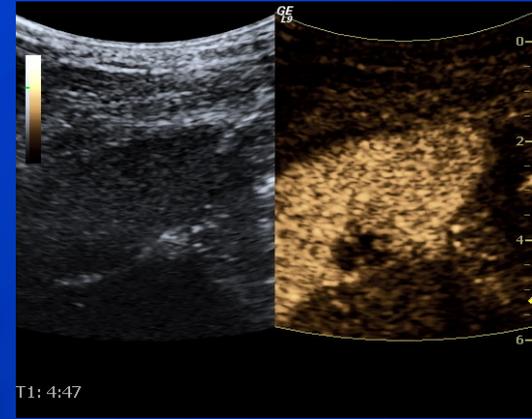

27
-27
cm/s

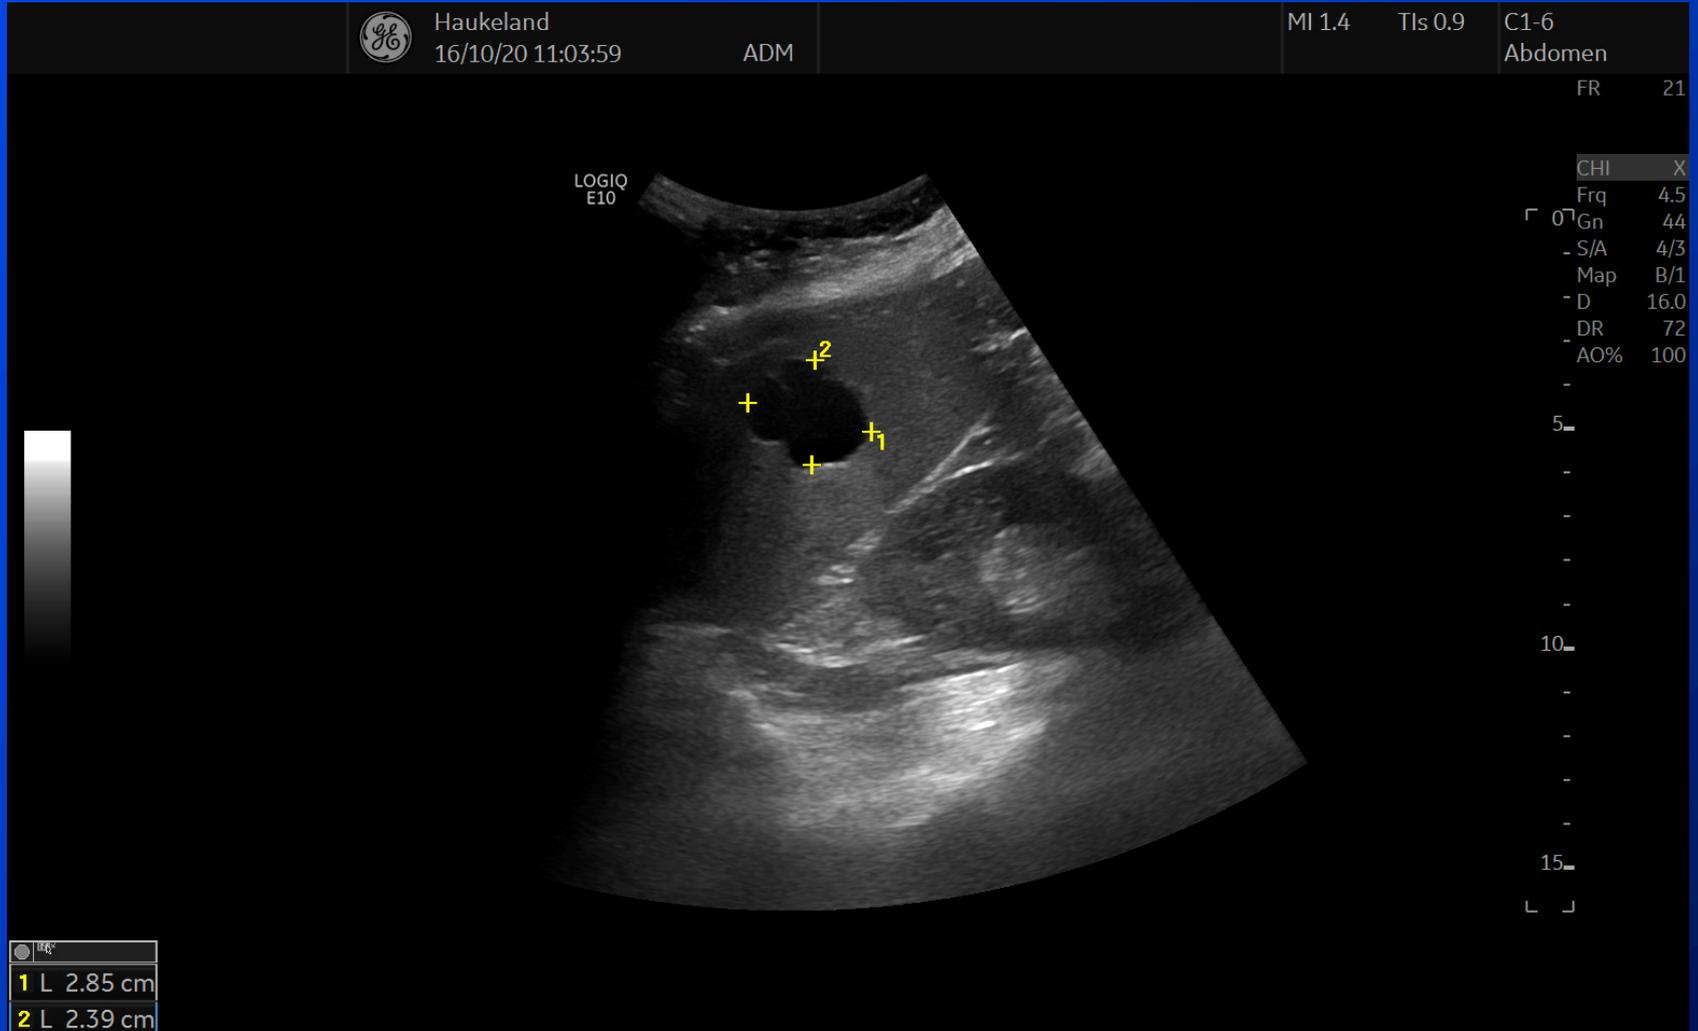

Neoplasms of the Spleen

- Hemangiomas
 - Most frequent benign lesion
- Cystic lesions
 - Congenital (may contain cholesterol debris)
 - Post-traumatic lesions (residual hematoma)
 - 4 times more common than true cysts
 - Pancreatic pseudocysts
 - Echinococcus-cyst (usually multilocular)
- Lymphoma
- Primary angiosarcoma
- Metastasis
 - Rare, melanoma is most frequent, then ovaries
 - Usually hypoechoic, but hemorrhagic necrosis within tumor can appear hyperechogenic

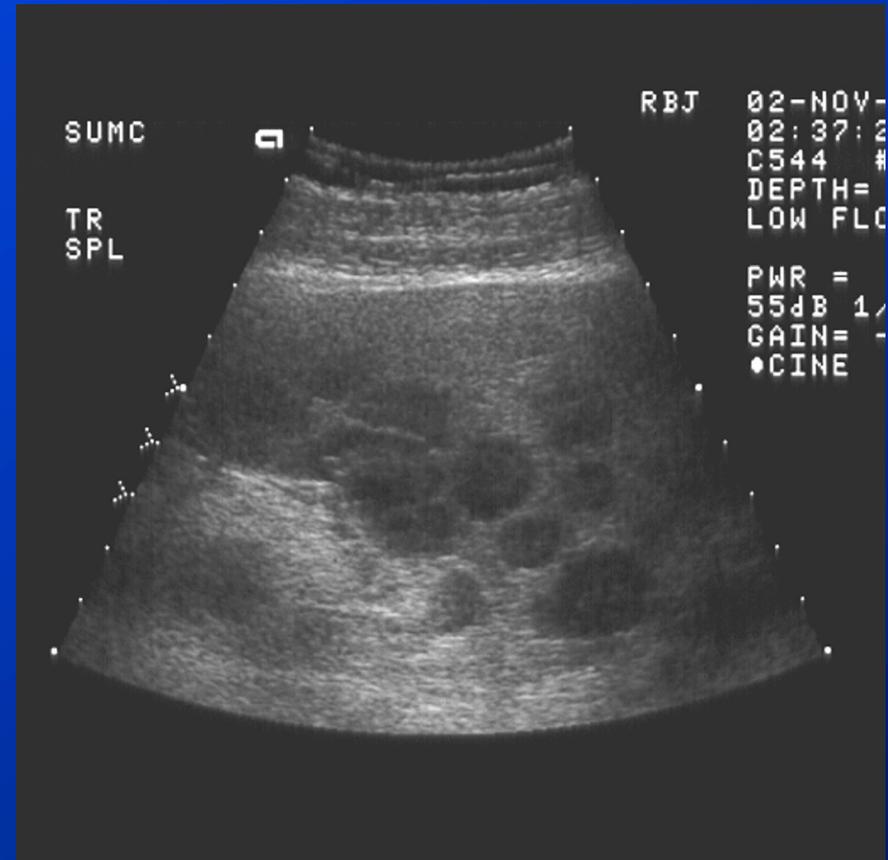

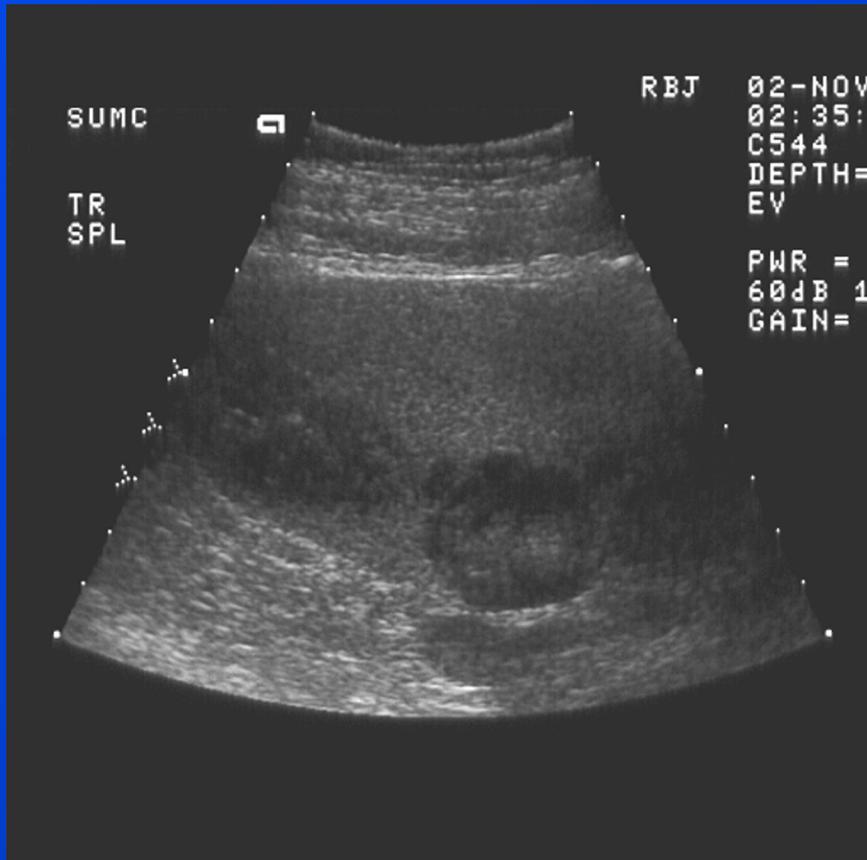

Simple cyst

Lymphoma of the spleen

HISTORY: 39-year-old male with vague left upper quadrant pain

Transverse sonograms of the spleen demonstrating multiple rounded hypoechoic lesions with little enhanced sound transmission.

Metastasis to the Spleen

HISTORY: 47-year-old female with known ovarian carcinoma.

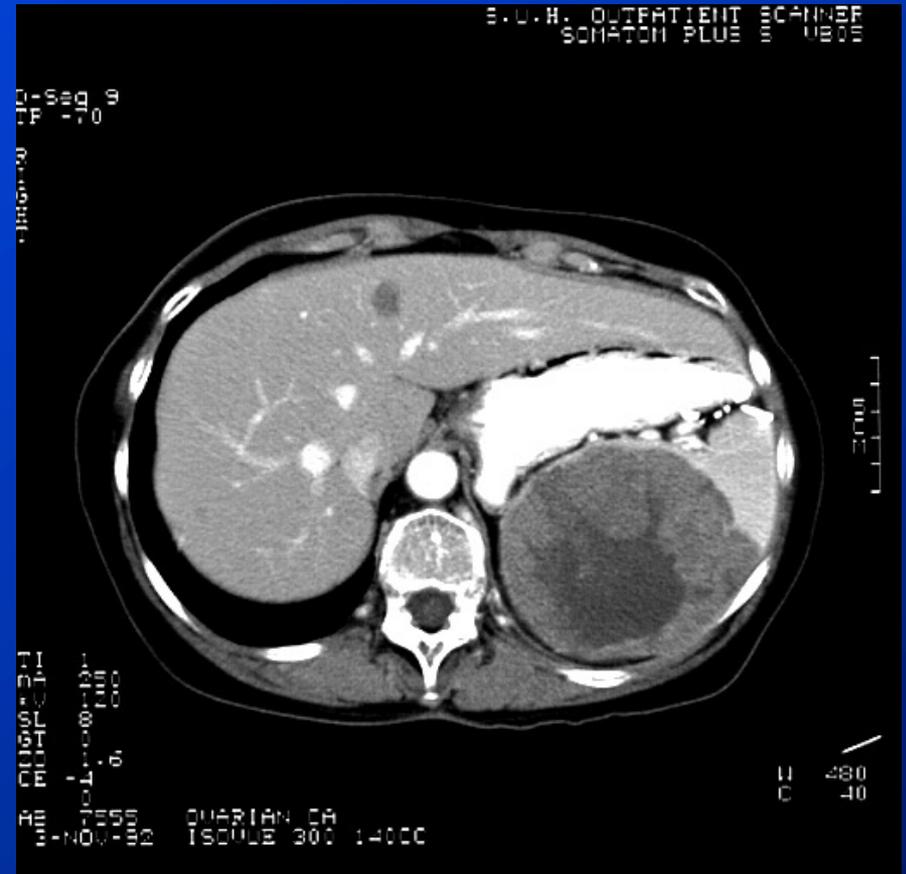

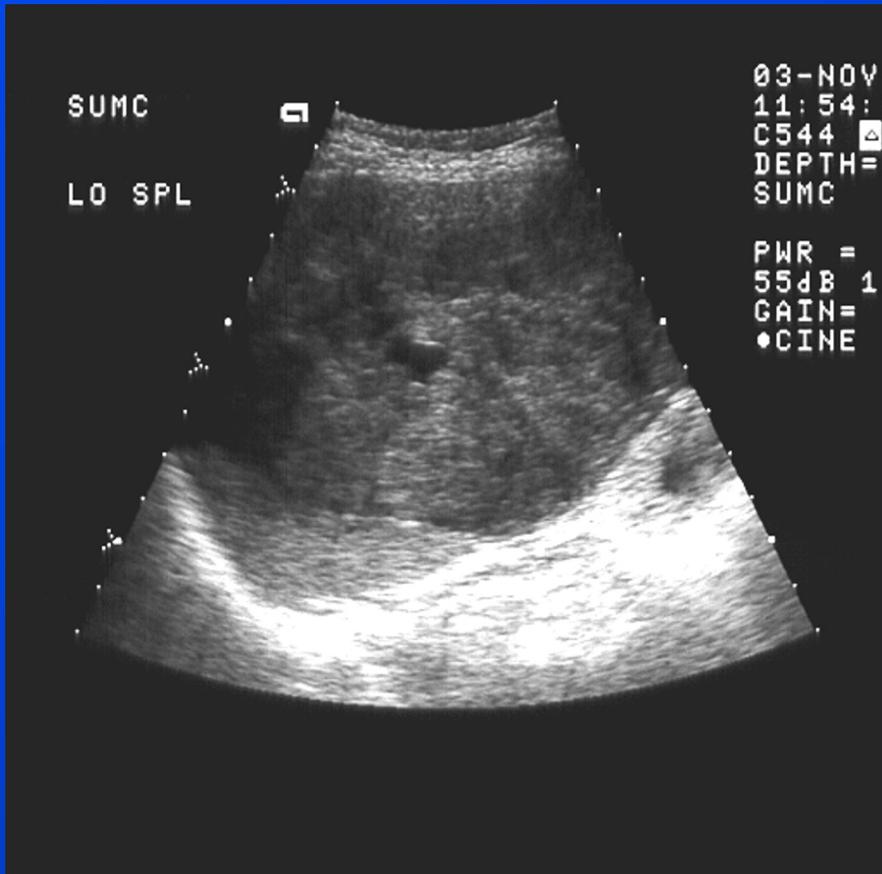

Image 1: A large lesion of mixed echogenicity occupying most of the spleen.

Image 2: Contrast-enhanced CT scan demonstrating a large low attenuating splenic lesion with areas of decreased attenuation centrally, probably related to necrosis.

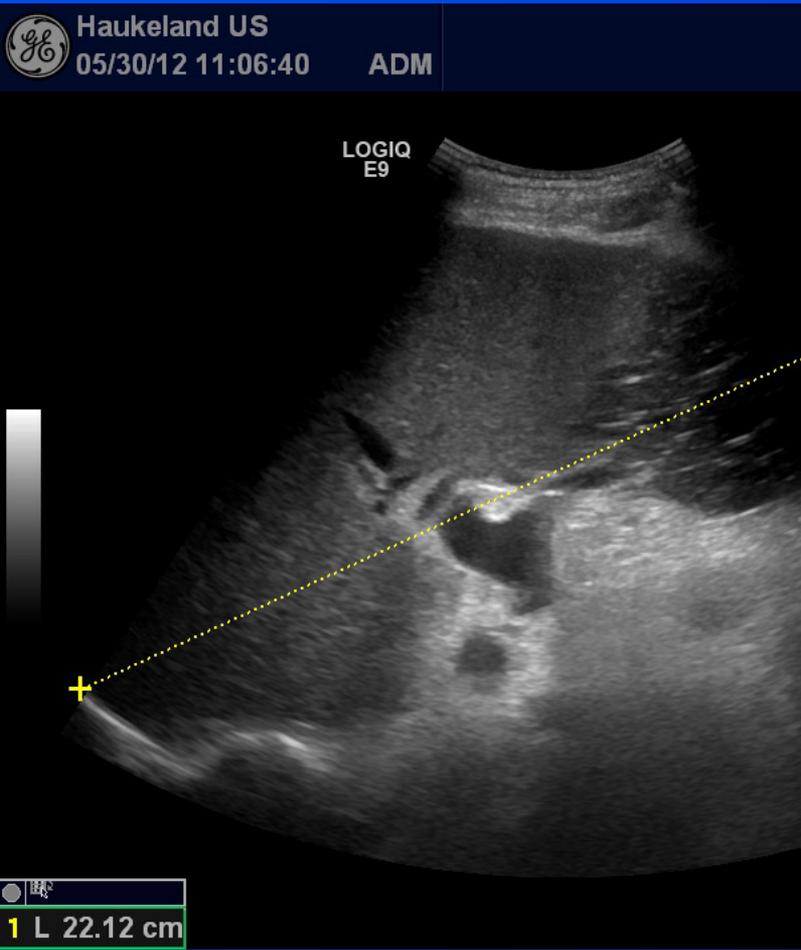

Vascular Lesions of the Spleen

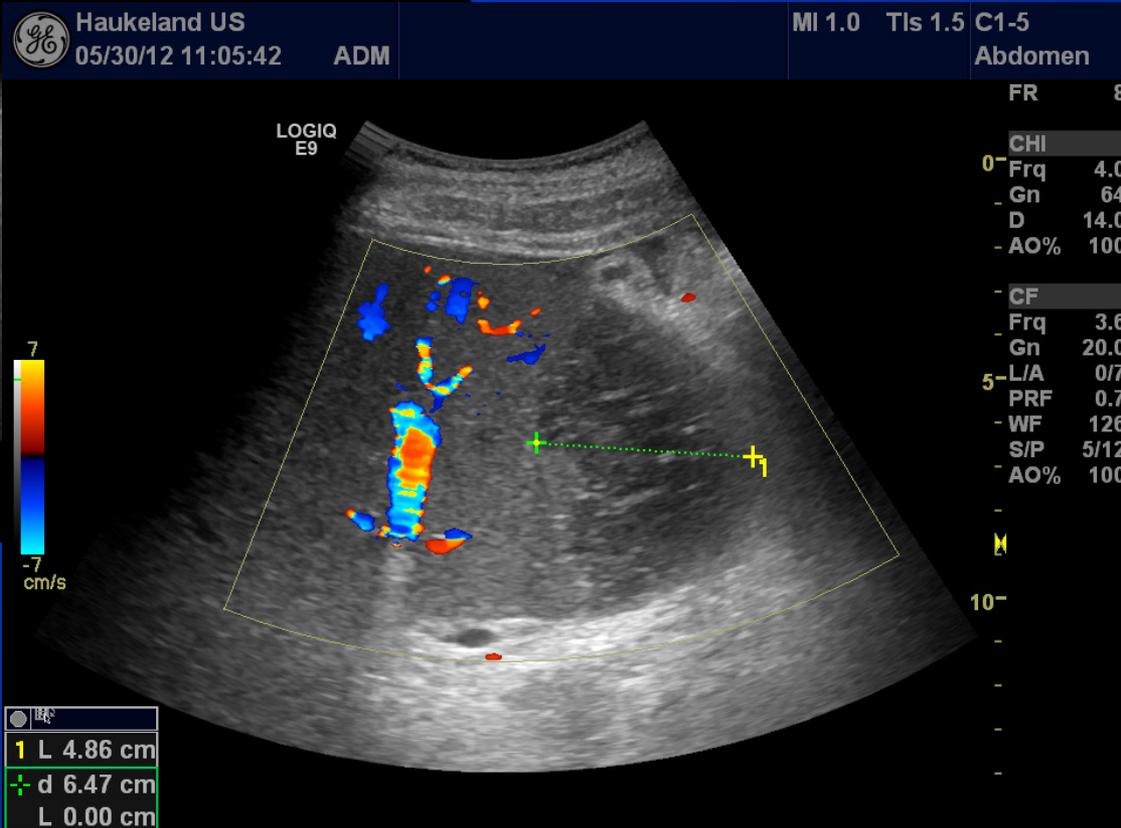

- Infarction
 - Wedge-shaped, often peripheral
 - Usually hypo-echoic
 - Septic infarcts may turn into a rounded lesion
- Aneurysm
 - Often related to atherosclerotic disease
 - Lesions larger than 1 cm should be followed
- Subcapsular hematoma
 - Often following trauma or massive splenomagaly
 - Look for discontinuity of the capsula and locations of free fluid
